

CS 260: Foundations Of Computer Science

Class 11 - September 28, 2012

1

Thought for the Day

**Beware the man who won't be
bothered with details.**

2

Today's Agenda

- Chapter 5 – Searching & Sorting

3

Fun with computers...

4

The 90-90 rule of project schedules

The first 90% of a task takes
90% of the time
and the last 10% takes the other
90% of the time.

5

Where do I start?

- Start with your class diagram. Write the Python (or ...) class for that Abstract Data Type.
 - Write some code to test your ADT. Be sure to include some way to print it out so you can see it.
- Build other classes in your diagrams.
- Write code that uses your classes... (your "main" program).
- Test everything!!

6

Searching and Sorting Chapter 5

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Nizaine.

Searching

- The process of selecting particular information from a collection of data based on specific criteria.
 - Can be performed on different data structures.
 - **sequence search** – search within a sequence.
 - **search key** (or key) – identifies a specific item.
 - **compound key** – consists of multiple parts.

Chapter 5: Searching and Sorting – 10

Linear Search

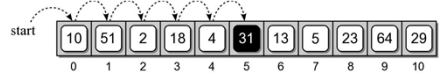

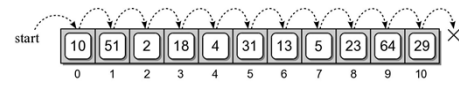

- Iterates over the sequence, item by item, until the specific item is found or the list is exhausted.
 - The simplest solution to sequence search problem.
 - Python's **in** operator: find a specific item.

```
if key in theArray :
    print( 'The key is in the array.' )
else :
    print( 'The key is not in the array.' )
```

Chapter 5: Searching and Sorting – 11

Linear Search Examples

- Searching for 31
 
- Searching for 8
 

Chapter 5: Searching and Sorting – 12

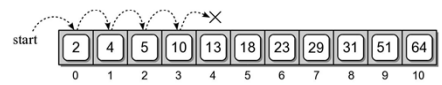

Linear Search Code

```
def linearSearch( theValues, target ) :
    n = len( theValues )
    for i in range( n ) :
        if theValues[i] == target:
            return True
```

Chapter 5: Searching and Sorting – 13

Linear Search: Sorted Sequence

- A linear search can be performed on a sorted sequence.
- Example: searching for 8.
 

Chapter 5: Searching and Sorting – 14

Linear Search: Sorted Sequence

- Similar to the unsorted sequence, with one major difference.

```
def sortedLinearSearch( theValues, target ) :
    n = len( theValues )
    for i in range( n ) :
        if theValues[i] == target :
            return True
        elif theValues[i] > target :
            return False
    return False
```

Chapter 5: Searching and Sorting - 15

Linear Search: Smallest Value

- We can search for an item based on certain criteria.
- Example: Find the smallest value.

```
def findSmallest( theValues ) :
    n = len( theValues )
    smallest = theValues[0]
    for i in range( 1, n ) :
        if theList[i] < smallest :
            smallest = theValues[i]
    return smallest
```

Chapter 5: Searching and Sorting - 16

Binary Search

- The linear search has a linear time-complexity.
- We can improve the search time if we modify the search technique itself.
- Use a **divide and conquer** strategy.
- Requires a sorted sequence.

2	4	5	10	13	18	23	29	31	51	64
0	1	2	3	4	5	6	7	8	9	10

Chapter 5: Searching and Sorting - 17

Binary Search Algorithm

- Examine the middle item (searching for 10):

2	4	5	10	13	18	23	29	31	51	64
					start					

- One of three possible conditions:
 - target is found in the middle item.
 - target is less than the middle item.
 - target is greater than the middle item.

Chapter 5: Searching and Sorting - 18

Binary Search Algorithm

- Since the sequence is sorted, we can eliminate half the values from further consideration.

2	4	5	10	13	18	23	29	31	51	64

Chapter 5: Searching and Sorting - 19

Binary Search Algorithm

- Repeat the process until either the target is found or all items have been eliminated.

2	4	5	10	13	18	23	29	31	51	64
2	4	5	10	13	18	23	29	31	51	64
			10	13	18	23	29	31	51	64

Chapter 5: Searching and Sorting - 20

Binary Search Implementation

```

def binarySearch( theValues, target ) :
    low = 0
    high = len(theValues) - 1

    while low <= high :
        mid = (high + low) // 2
        if theValues[mid] == target :
            return True
        elif target < theValues[mid] :
            high = mid - 1
        else :
            low = mid + 1

    return False
    
```

Binary Search Implementation

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting – 22

Sorting

- The process of arranging a collection of items such that each item and its successor satisfy a prescribed relationship.
 - sequence sort** – sorting within a sequence.
 - sort key** – values on which items are ordered.
 - items arranged in ascending or descending order.
 - sorted in place – within the same structure.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting – 23

Bubble Sort

- A simple solution to the sorting problem.
- Arranges the items by
 - iterating over the sequence multiple times.
 - larger values bubble to the top (or end).

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting – 24

Bubble Sort Code

```

def bubbleSort( theSeq ) :
    n = len( theSeq )
    for i in range( n - 1 ) :
        # for j in range( i + n - 1 ) : # ERROR!
        for j in range( n - i - 1 ) : # CORRECTION!
            if theSeq[j] > theSeq[j + 1] :
                # swap the j and j+1 items.
                tmp = theSeq[j]
                theSeq[j] = theSeq[j + 1]
                theSeq[j + 1] = tmp
    
```

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting – 25

Bubble Sort Example

- First complete iteration of the inner loop.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting – 26

Bubble Sort Example

Chapter 5: Searching and Sorting - 27

Bubble Sort Example

- Results after each iteration of the outer loop.

Chapter 5: Searching and Sorting - 28

Bubble Sort Example

Chapter 5: Searching and Sorting - 29

Selection Sort

- Improves on the bubble sort.
- Works in a fashion similar to what a human may use to sort a sequence.
- Instead of swapping many items,
 - repeatedly selects the next largest item from among the unsorted items.
 - requires a search to select the smallest item.

Chapter 5: Searching and Sorting - 30

Selection Sort Code

```
def selectionSort( theSeq ):
    n = len( theSeq )
    for i in range( n - 1 ):
        smallNdx = i
        for j in range( i + 1, n ):
            if theSeq[j] < theSeq[smallNdx] :
                smallNdx = j

        if smallNdx != i :
            tmp = theSeq[i]
            theSeq[i] = theSeq[smallNdx]
            theSeq[smallNdx] = tmp
```

Chapter 5: Searching and Sorting - 31

Selection Sort Example

Chapter 5: Searching and Sorting - 32

Selection Sort Example

Chapter 5: Searching and Sorting - 33

Insertion Sort

- Another commonly studied algorithm.
- Arranges the items by
 - iterating over the sequence one complete time.
 - inserts each unsorted item into its proper place.

Chapter 5: Searching and Sorting - 34

Insertion Sort Code

```
def insertionSort( theSeq ):
    n = len( theSeq )
    for i in range( 1, n ) :
        value = theSeq[i]

        pos = i
        while pos > 0 and value < theSeq[pos - 1] :
            theSeq[pos] = theSeq[pos - 1]
            pos -= 1

        theSeq[pos] = value
```

Chapter 5: Searching and Sorting - 35

Insertion Sort Example

Chapter 5: Searching and Sorting - 36

Insertion Sort Example

Chapter 5: Searching and Sorting - 37

Working With Sorted Lists

- The efficiency of some algorithms can be improved when working with sorted sequences.
 - For non-static collections, it would be inefficient to re-sort a sequence for each add/remove.
 - Better to maintain a sorted sequence.

Chapter 5: Searching and Sorting - 38

Maintaining a Sorted List

- To maintain a sorted list, new items must be inserted into their proper position.
- Can not simply be appended at the end.
- Must locate the proper position and use `insert()`.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 39

Modified Binary Search

- A modified version of the binary search can be used to find the proper location of an item.

```
def findSortedPosition( theList, target ):
    low = 0
    high = len(theList) - 1
    while low <= high :
        mid = (high + low) // 2
        if theList[mid] == target :
            return mid # Index of the target.
        elif target < theList[mid] :
            high = mid - 1
        else :
            low = mid + 1

# Index where the target value should be.
return low
```

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 40

Merging Sorted Lists

- Sometimes it may be necessary to merge two sorted lists into a new list.
- For example

```
listA = [ 2, 8, 15, 23, 37 ]
listB = [ 4, 6, 15, 20 ]
newList = mergeSortedLists( listA, listB )
print( newList )
```

creates a new merged list

```
[ 2, 4, 6, 8, 15, 15, 20, 23, 37 ]
```

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 41

Merging Algorithm

- We can use an approach similar to what you might do, if merging two stacks of cards by hand.
- Examine the value of the top card.
- Select the smallest of the two.
- Flip it over and place it on top of a third stack.
- Repeat until one of the two original stacks is empty.
- Finally, flip all of the cards in the remaining stack onto the top of the new stack.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 42

Merging Example

ListA	ListB	newList
[2, 8, 15, 23, 37]	[4, 6, 15, 20]	
[2, 8, 15, 23, 37]	[4, 6, 15, 20]	[2]
[2, 8, 15, 23, 37]	[4, 6, 15, 20]	[2, 4]
[2, 8, 15, 23, 37]	[4, 6, 15, 20]	[2, 4, 6]
[2, 8, 15, 23, 37]	[4, 6, 15, 20]	[2, 4, 6, 8]

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 43

Merging Example

ListA	ListB	newList
[2, 8, 15, 23, 37]	[4, 6, 15, 20]	[2, 4, 6, 8, 15]
[2, 8, 15, 23, 37]	[4, 6, 15, 20]	[2, 4, 6, 8, 15, 15]
[2, 8, 15, 23, 37]	[4, 6, 15, 20]	[2, 4, 6, 8, 15, 15, 20]
[2, 8, 15, 23, 37]	[4, 6, 15, 20]	[2, 4, 6, 8, 15, 15, 20, 23]
[2, 8, 15, 23, 37]	[4, 6, 15, 20]	[2, 4, 6, 8, 15, 15, 20, 23, 37]

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 44

Merging Implementation

```
def mergeSortedLists( listA, listB ) :
    newList = list()
    a = 0
    b = 0
    while a < len( listA ) and b < len( listB ) :
        if listA[a] < listB[b] :
            newList.append( listA[a] )
            a += 1
        else :
            newList.append( listB[b] )
            b += 1
    while a < len( listA ) :
        newList.append( listA[a] )
        a += 1
    while b < len( listB ) :
        newList.append( listB[b] )
        b += 1
    return newList
```

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 45

Merging Analysis

- Assume listA and listB each contain n items.
- The worst case depends on the number of iterations performed by all three loops combined.
 - Max iterations of the 1st loop:
 - occurs when the selection alternates between the two lists.
 - 2n - 1 iterations + 1 iteration of either of the next two loops.
 - Min iterations of the 1st loop:
 - occurs when all values of one list are selected in order.
 - n iterations + n iterations of either of the next two loops.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 46

Set ADT Revisited

- We examined the worst case run-times in the previous chapter.
 - The *contains* operation required linear time due to the linear search.
 - The quadratic times of some operations were due to the use of linear *contains* operation.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 47

Set ADT: Run-Times

List Operation	Worst Case
s = Set()	O(1)
len(s)	O(1)
x in s	O(n)
s.add(x)	O(n)
s.isSubsetOf(t)	O(n ²)
s == t	O(n ²)
s.union(t)	O(n ²)
traversal	O(n)

If we could improve the speed of these operations...

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 48

Set ADT: Sorted List

- Can the efficiency of the set operations be improved if we used a sorted list?
- What changes would be necessary?

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 49

Set Class: Sorted List

binaryset.py

```
class Set :
    def __init__( self ) :
        self._theElements = list()
    def __len__( self ) :
        return len( self._theElements )
    def __contains__( self, element ) :
        ndx = self._findPosition( element )
        return ndx < len( self ) and\
            self._theElements[ndx] == element
# ...
```

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise. Chapter 5: Searching and Sorting - 50

Set Class: Sorted List

binaryset.py

```

class Set :
# ...
def add( self, element ) :
    if element not in self :
        ndx = self._findPosition( element )
        self._theElements.insert( ndx, element )

def remove( self, element ) :
    assert element in self,
        "The element must be in the set."
    ndx = self._findPosition( element )
    return self._theElements.pop( ndx )
    
```

Chapter 5: Searching and Sorting - 51

Set Class: Sorted List

binaryset.py

```

class Set :
# ...
def isSubsetOf( self, setB ) :
    for element in self :
        if element not in setB :
            return False
    return True
    
```

Chapter 5: Searching and Sorting - 52

Comparing Implementations

Operation	Linear Set	Binary Set
s = Set()	O(1)	O(1)
len(s)	O(1)	O(1)
x in s	O(n)	O(log n)
s.add(x)	O(n)	O(n)
s.isSubsetOf(t)	O(n ²)	O(n log n)
s == t	O(n ²)	
s.union(t)	O(n ²)	
traversal	O(n)	O(n)

Chapter 5: Searching and Sorting - 53

New Set Equals

- If we use the original isSubsetOf(), the result is a worst case time of O(n log n).

```

class Set :
# ...
def __eq__( self, setB ) :
    if len( self ) != len( setB ) :
        return False
    else :
        return self.isSubsetOf( setB )
    
```

Chapter 5: Searching and Sorting - 54

New Set Equals

- A more efficient implementation is possible.

```

class Set :
# ...
def __eq__( self, setB ) :
    if len( self ) != len( setB ) :
        return False
    else :
        for i in range( len( self ) ) :
            if self._theElements[i] != setB._theElements[i] :
                return False
        return True
    
```

Chapter 5: Searching and Sorting - 55

New Set Union

- The efficiency of the set union operation can also be improved.
- Set union using two sorted lists is very similar to the problem of merging two sorted lists.
 - The new list only contains unique elements.
 - If both lists contains a given element, only one instance is placed in the new list.

Chapter 5: Searching and Sorting - 56

Set Class: Sorted List

binaryset.py

```

class Set :
# ...
def union( self, setB ) :
    newSet = Set()
    a = 0
    b = 0
    while a < len( self ) and b < len( setB ) :
        valueA = self._theElements[a]
        valueB = setB._theElements[b]
        if valueA < valueB :
            newSet._theElements.append( valueA )
            a += 1
        elif valueA > valueB :
            newSet._theElements.append( valueB )
            b += 1
        else :
            newSet._theElements.append( valueA )
            a += 1
            b += 1
    
```

Chapter 5: Searching and Sorting - 57

Set Class: Sorted List

binaryset.py

```

class Set :
# ...
def union( self, setB ) :
# ...
    while a < len( self ) :
        newSet._theElements.append(self._theElements[a])
        a += 1
    while b < len( setB ) :
        newSet._theElements.append(setB._theElements[b])
        b += 1
    return newSet
    
```

Chapter 5: Searching and Sorting - 58

Comparing Implementations

Operation	Linear Set	Binary Set
s = Set()	O(1)	O(1)
len(s)	O(1)	O(1)
x in s	O(n)	O(log n)
s.add(x)	O(n)	O(n)
s.isSubsetOf(t)	O(n ²)	O(n)
s == t	O(n ²)	O(n)
s.union(t)	O(n ²)	O(n)
traversal	O(n)	O(n)
