

Minimum Spanning Trees

Graphs

A graph is a set of vertices V and a set of edges $(u,v) \in E$ where $u,v \in V$

Different types of graphs

Undirected – edges do not have a direction

Different types of graphs

Directed – edges **do** have a direction

Different types of graphs

Weighted – edges have an associated weight

Terminology

Path – A path is a list of vertices $p_1, p_2, \dots, p_k$ where there exists an edge $(p_i, p_{i+1}) \in E$

Different types of graphs

Weighted – edges have an associated weight

Terminology

Path – A path is a list of vertices $p_1, p_2, \dots, p_k$ where there exists an edge $(p_i, p_{i+1}) \in E$

$\{A, B, D, E, F\}$

Terminology

Cycle – A subset of the edges that form a path such that the first and last node are the same

Terminology

Cycle – A subset of the edges that form a path such that the first and last node are the same

Terminology

Cycle – A path $p_1, p_2, \dots, p_k$ where $p_1 = p_k$

Terminology

Connected – every pair of vertices is connected by a path

Terminology

Strongly connected (directed graphs) –
Every two vertices are reachable by a path

strongly
connected

Different types of graphs

Tree – connected, undirected graph without
any cycles

Different types of graphs

DAG – directed, acyclic graph

Road Repaving Problem

Minimum spanning trees

What is the lowest weight set of edges that connects all vertices of an undirected graph with positive weights

Input: An undirected, positive weight graph, $G=(V,E)$

Output: A tree $T=(V,E')$ where $E' \subseteq E$ that minimizes

$$weight(T) = \sum_{e \in E'} w_e$$

MST example

MSTs

Can an MST have a cycle?

MSTs

How many edges will a MST have?

Applications?

Connectivity

- Networks (e.g. communications)
- Circuit design/wiring

Hub/spoke models (e.g. flights, transportation)

Photo Credit:
Aaron Koblin

Worksheet:

- List all algorithms you can think of for finding *any* spanning tree for a graph (e.g., m.s.t. for graph with equal edge weights).

```

BFS( $G, s$ )
1  for each  $v \in V$ 
2       $dist[v] = \infty$ 
3   $dist[s] = 0$ 
4  ENQUEUE( $Q, s$ )
5  while !EMPTY( $Q$ )
6       $u \leftarrow$  DEQUEUE( $Q$ )
7      VISIT( $u$ )
8      for each edge  $(u, v) \in E$ 
9          if  $dist[v] = \infty$ 
10             ENQUEUE( $Q, v$ )
11              $dist[v] \leftarrow dist[u] + 1$ 

TREEBFS( $T$ )

```

Cuts

A cut is a partitioning of the vertices into two sets S and $V-S$

An edge “crosses” the cut if it connects a vertex $u \in V$ and $v \in V-S$

The “Generic” Greedy MST Algorithm

MST(Graph G):

```

T = {} # The tree we're growing!
while |T| < n-1 # n is num vertices
    Find a safe edge e in G - T
    T = T + e
return T

```

How do we determine if an edge is safe?

Minimum cut property

Given a partition S , let the light edge e be the minimum cost edge that **crosses** the partition. *Every* minimum spanning tree contains the light edge e .

Worksheet:
Prove this!

The case where edge weights are not distinct may show up as a future homework problem.

Minimum cut property

Given a partition S , let edge e be the minimum cost edge that **crosses** the partition. Every minimum spanning tree contains edge e .

Consider an MST with edge e' that is not the minimum edge

Minimum cut property

Given a partition S , let edge e be the minimum cost edge that **crosses** the partition. Every minimum spanning tree contains edge e .

Using e instead of e' , still connects the graph, but produces a tree with smaller weights

The “Generic” Greedy MST Algorithm

MST(Graph G):

```
T = {} # The tree we're growing!
while |T| < n-1 # n is num vertices
    Find a safe edge e in G - T
    T = T + e
return T
```

We proved that IF all the edge weights are distinct, the cheapest edge crossing a cut is always safe!

Algorithm ideas?

Kruskal's Algorithm (The idea)

- Start with each vertex being its own component
- Repeated merge components into one by choosing the light edge that connects them
 - Sort all edge in monotonically increasing order by weight
 - Use a disjoint-set data structure to determine whether an edge connects vertices in different components

Let's see if we can save Cheapville their pounds and pence!

Kruskal's algorithm

Given a partition S , let edge e be the minimum cost edge that **crosses** the partition. *Every* minimum spanning tree contains edge e .

```

KRUSKAL( $G$ )
1  for all  $v \in V$ 
2      MAKESET( $v$ )
3   $T \leftarrow \{\}$ 
4  sort the edges of  $E$  by weight
5  for all edges  $(u, v) \in E$  in increasing order of weight
6      if FIND-SET( $u$ )  $\neq$  FIND-SET( $v$ )
7          add edge to  $T$ 
8          UNION(FIND-SET( $u$ ), FIND-SET( $v$ ))
  
```

Kruskal's algorithm

Add smallest edge that connects two sets not already connected

G

MST

Kruskal's algorithm

Add smallest edge that connects

Kruskal's algorithm

Add smallest edge that connects
two sets not already connected

Kruskal's algorithm

Add smallest edge that connects
two sets not already connected

Kruskal's algorithm

Add smallest edge that connects
two sets not already connected

Kruskal's algorithm

Add smallest edge that connects
two sets not already connected

Correctness of Kruskal's

Never adds an edge that connects already connected vertices

Always adds lowest cost edge to connect two sets. By min cut property, that edge must be part of the MST

```

KRUSKAL( $G$ )
1  for all  $v \in V$ 
2      MAKESET( $v$ )
3   $T \leftarrow \{\}$ 
4  sort the edges of  $E$  by weight
5  for all edges  $(u, v) \in E$  in increasing order of weight
6      if FIND-SET( $u$ )  $\neq$  FIND-SET( $v$ )
7          add edge to  $T$ 
8          UNION(FIND-SET( $u$ ), FIND-SET( $v$ ))
    
```

Running time of Kruskal's

```

KRUSKAL( $G$ )
1  for all  $v \in V$ 
2      MAKESET( $v$ )
3   $T \leftarrow \{\}$ 
4  sort the edges of  $E$  by weight

8          UNION(FIND-SET( $u$ ), FIND-SET( $v$ ))
    
```

Running time of Kruskal's

1 for all $v \in V$	$ V $ calls to MakeSet
2 MAKESET(v)	
3 $T \leftarrow \{\}$	
4 sort the edges of E by weight	$O(E \log E)$
5 for all edges $(u, v) \in E$ in increasing order of weight	$2 E $ calls to FindSet
6 if FIND-SET(u) $\neq$ FIND-SET(v)	
7 add edge to T	$ V $ calls to Union
8 UNION(FIND-SET(u), FIND-SET(v))	

Running time of Kruskal's

Disjoint set data structure

	MakeSet	FindSet E calls	Union V calls	Total
		$O(E \log E) +$		
Linked lists	$ V $	$O(V E)$	$ V $	$O(V E + E \log E)$ $O(V E)$
Linked lists + heuristics	$ V $	$O(E \log V)$	$ V $	$O(E \log V + E \log E)$ $O(E \log E)$

Prim's Algorithm (The Idea)

- Incrementally build tree
 - Pick any root
 - At each step, find light edge that crosses the cut T, G-T
- Implemented using a priority queue
 - Priorities represent costs connect to T
 - Extract-Min chooses the edge to add
 - Decrease-Key updates priorities of crossing edges

Let's see if we can save Cheapville their pounds and pence!

Prim's algorithm

```

PRIM( $G, r$ )
1  for all  $v \in V$ 
2       $key[v] \leftarrow \infty$ 
3       $prev[v] \leftarrow null$ 
4   $key[r] \leftarrow 0$ 
5   $H \leftarrow MAKEHEAP(key)$ 
6  while !Empty( $H$ )
7       $u \leftarrow EXTRACT-MIN(H)$ 
8       $visited[u] \leftarrow true$ 
9      for each edge  $(u, v) \in E$ 
10         if !visited[v] and  $w(u, v) < key[v]$ 
11             DECREASE-KEY( $v, w(u, v)$ )
12              $prev[v] \leftarrow u$ 
    
```

Prim's algorithm

```

PRIM( $G, r$ )
1  for all  $v \in V$ 
2       $key[v] \leftarrow \infty$ 
3       $prev[v] \leftarrow null$ 
4   $key[r] \leftarrow 0$ 
5   $H \leftarrow \text{MAKEHEAP}(key)$ 
6  while !Empty( $H$ )
7       $u \leftarrow \text{EXTRACT-MIN}(H)$ 
8       $visited[u] \leftarrow true$ 
9      for each edge  $(u, v) \in E$ 
10         if !visited[ $v$ ] and  $w(u, v) < key[v]$ 
11             DECREASE-KEY( $v, w(u, v)$ )
12              $prev[v] \leftarrow u$ 
    
```

MST

Prim's algorithm

Start at some root node and build out the MST by adding the lowest weighted edge at the frontier

```

PRIM( $G, r$ )
1  for all  $v \in V$ 
2       $key[v] \leftarrow \infty$ 
3       $prev[v] \leftarrow null$ 
4   $key[r] \leftarrow 0$ 
5   $H \leftarrow \text{MAKEHEAP}(key)$ 
6  while !Empty( $H$ )
7       $u \leftarrow \text{EXTRACT-MIN}(H)$ 
8       $visited[u] \leftarrow true$ 
9      for each edge  $(u, v) \in E$ 
10         if !visited[ $v$ ] and  $w(u, v) < key[v]$ 
11             DECREASE-KEY( $v, w(u, v)$ )
12              $prev[v] \leftarrow u$ 
    
```

MST

```

6 while !Empty(H)
7   u ← EXTRACT-MIN(H)
8   visited[u] ← true
9   for each edge (u,v) ∈ E
10    if !visited[v] and w(u,v) < key(v)
11      DECREASE-KEY(v, w(u,v))
12    prev[v] ← u

```

```

6 while !Empty(H)
7   u ← EXTRACT-MIN(H)

Correctness of Prim's?

Can we use the min-cut property?

- Given a partition S , let edge e be the minimum cost edge that **crosses** the partition. Every minimum spanning tree contains edge e .

Let S be the set of vertices visited so far

The only time we add a new edge is if it's the lowest weight edge from S to $V-S$

Running time of Prim's

```

PRIM( $G, r$ )
1 for all  $v \in V$ 
2    $key[v] \leftarrow \infty$ 
3    $prev[v] \leftarrow null$ 
4  $key[r] \leftarrow 0$ 
5  $H \leftarrow MAKEHEAP(key)$ 
6 while !Empty( $H$ )
7    $u \leftarrow EXTRACT-MIN(H)$ 
8    $visited[u] \leftarrow true$ 
9   for each edge  $(u,v) \in E$ 
10    if !visited[v] and  $w(u,v) < key[v]$ 
11      DECREASE-KEY( $v, w(u,v)$ )
12     $prev[v] \leftarrow u$ 

```

Running time of Prim's

PRIM(G, r)

```

1  for all  $v \in V$ 
2       $key[v] \leftarrow \infty$ 
3       $prev[v] \leftarrow null$ 
4   $key[r] \leftarrow 0$ 
5   $H \leftarrow MAKEHEAP(key)$ 
6  while !Empty( $H$ )
7       $u \leftarrow EXTRACT-MIN(H)$ 
8       $visited[u] \leftarrow true$ 
9      for each edge  $(u, v) \in E$ 
10         if ! $visited[v]$  and  $w(u, v) < key[v]$ 
11             DECREASE-KEY( $v, w(u, v)$ )
12          $prev[v] \leftarrow u$ 
    
```

$\Theta(|V|)$

$\Theta(|V|)$

$|V|$ calls to Extract-Min

$|E|$ calls to Decrease-Key

Running time of Prim's

	1 MakeHeap	$ V $ ExtractMin	$ E $ DecreaseKey	Total
Array	$O(V)$	$O(V ^2)$	$O(E)$	$O(V ^2)$
Bin heap	$O(V)$	$O(V \log V)$	$O(E \log V)$	$O((V + E) \log V)$ $O(E \log V)$
Fib heap	$O(V)$	$O(V \log V)$	$O(E)$	$O(V \log V + E)$

Kruskal's: $O(|E| \log |E|)$

Otakar Borůvka

Otakar Borůvka was a Czech mathematician best known today for his work in graph theory, long before this was an established mathematical discipline. [Wikipedia](#)

Born: May 10, 1899, Uherský Ostroh

Died: July 22, 1995

You'll meet Boruvka in PS 7b!!

MST Alternative?

Worksheet

Professor Borden proposes a new divide-and-conquer algorithm for computing minimum spanning trees, which goes as follows. Given a graph $G = (V, E)$, partition the set V of vertices into two sets V_1 and V_2 such that $|V_1|$ and $|V_2|$ differ by at most 1. Let E_1 be the set of edges that are incident only on vertices in V_1 , and let E_2 be the set of edges that are incident only on vertices in V_2 . Recursively solve a minimum-spanning-tree problem on each of the two subgraphs $G_1 = (V_1, E_1)$ and $G_2 = (V_2, E_2)$. Finally, select the minimum-weight edge in E that crosses the cut (V_1, V_2) , and use this edge to unite the resulting two minimum spanning trees into a single spanning tree.

Either argue that the algorithm correctly computes a minimum spanning tree of G , or provide an example for which the algorithm fails.
