Introduce tuple relational calculus queries (based on Levene & Loizou)

Formal definition of domain relational calculus

#### Example tuple calculus query

Student(s-id, name, major, f-id, age)

Differences between Ramakrishnan/Gehrke & Levene/Loizou:

- 1. Capital letters for tuple variables rather than lower case letters.
- 2. Using the relation name (e.g., Student) to represent the current relation (what is called "r" in the textbook).
- Using the notation T.major to refer to one value in a tuple rather than t(major) as in the textbook.

```
\{ T \mid T \in Student \land T.age > 30 \land T.major = "CS" \}
```

What does this query find for us?

CS 589, Principles of Database Systems, © 2016 David Maier

3

### Relational algebra vs. relational calculus

A relational algebra query is a well-formed expression with relational algebra operators

Student(s-id, name, major, f-id, age)

 $(\sigma_{age < 20} Student) \cup (\sigma_{age > 50} Student)$ 

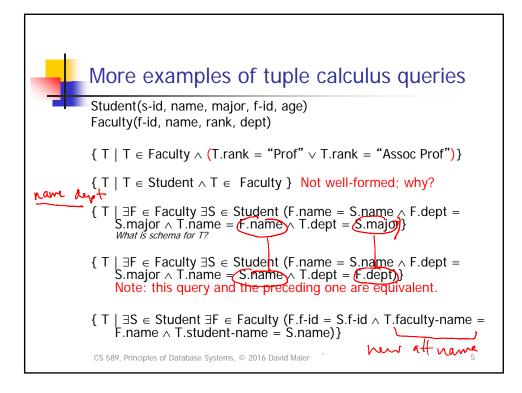

A tuple relational calculus query is a set-definition of form  $\{T \mid F(T)\}$ 

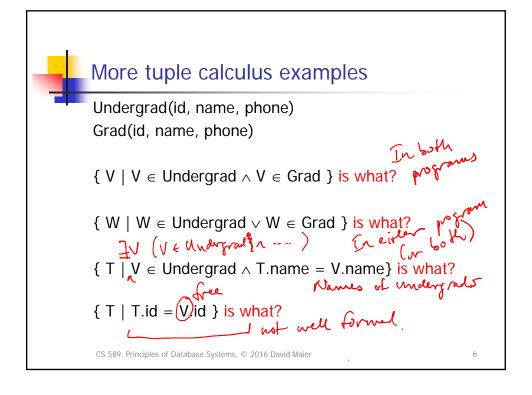

where T is a tuple variable and F is a logical expression, with T as the only free variable, that evaluates to true or false.

 $\{ T \mid T \in Student \land (T.Age < 20 \lor T.Age > 50) \}$ 

In SQL,

Select \* From Student S Where (S.Age < 20 or S.Age > 50) CS 589, Principles of Database Systems, © 2016 David Maler

#### In-class exercise

Explain each of these relational algebra queries in English and write each of them in tuple calculus.

Student(s-id, name, major, f-id, age) Faculty(f-id, name, rank, dept)

- 1.  $(\pi_{\text{name}}(\sigma_{\text{age}=21}\text{Student})) \cup \pi_{\text{name}}\text{Faculty})$
- 2.  $\pi_{s-id.name.f-id}$ (Student  $\bowtie$  Faculty)
- 3.  $(\pi_{\text{name}}(\sigma_{\text{age}=21}\text{Student})) (\pi_{\text{name}}(\sigma_{\text{major}=\text{"CS"}}\text{Student}))$

CS 589, Principles of Database Systems, © 2016 David Maier

7

### More tuple calculus examples

Student(s-id, name, major, f-id, age) Faculty(f-id, name, rank, dept)

faculty who advise some student  $\{T \mid T \in Faculty \land \exists S \in Student (S.f-id = T.f-id)\}$   $\{T \mid T \in Faculty \land \forall S \in Student (S.f-id = T.f-id)\}$  an faculty member who advise all What does each query find for us?

How would you express each in relational algebra?

# Definition of tuple-calculus syntax (Ramakrishnan & Gehrke)

*Rel* is a relation name, R and S are tuple variables, a is an attribute of R, b is an attribute of S, op is one of  $\{<, >, =, \le, \ge, \ne\}$ 

An atomic formula is one of the following:

 $R \in Rel$ 

R.a op S.b

R.a op constant (or constant op R.a)

#### A formula is:

any atomic formula

 $\neg F$ , (F),  $F1 \land F2$ ,  $F1 \lor F2$ ,  $F1 \Rightarrow F2$  (if F, F1, and F2 are formula)

 $\exists R \in Rel(F(R))$  where F is formula with R a free variable

 $\forall R \in Rel(F(R))$  where F is a formula with R a free variable

A tuple calculus query is an expression of the form:

 $\{T \mid F(T)\}$  where T is the only free variable in F

Note: all of the variables are tuple variables.

CS 589, Principles of Database Systems, © 2016 David Maier

9

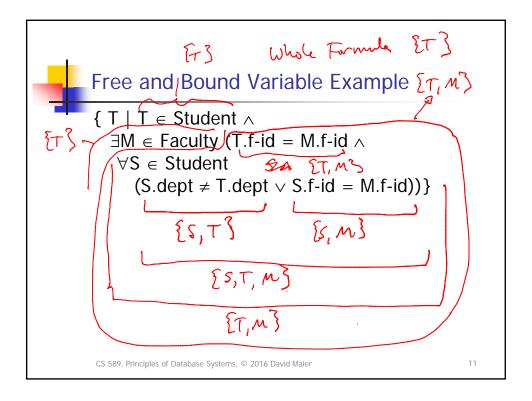

#### Bound and free variables

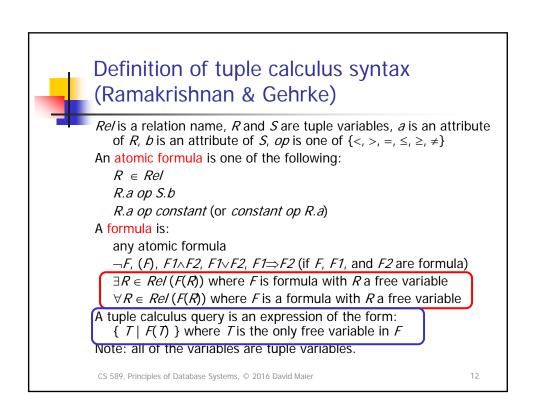

See pages 35-37 in our textbook.

Free variables in a formula are defined as:

- 1. All the variables occurring in an atomic formula are free.
- The free variables in  $F \wedge G$  are the free variables of F plus the free variables of G.
- The free variables in  $F \lor G$  are the free variables of F plus the free variables of G.
- The free variables in (F) or  $\neg F$  are the free variables of F.
- In  $\exists x \ F$  or  $\forall x \ F$ , the free variables are the free variables of F except for x. We say x is a bound variable when it appears with  $\exists$  or  $\forall$ .

CS 589, Principles of Database Systems, © 2016 David Maier

#### Domain calculus uses domain variables

Domain calculus is very similar to tuple calculus. We use domain variables rather than tuple variables.

Tuples can be substituted for tuple variables. Domain values (like 6 or "Smith") can be substituted for domain variables.

15

#### **Exercise**

Write each of the following queries in domain calculus.

Student(s-id, name, major, f-id, age) Faculty(f-id, name, rank, dept)

- 1.  $(\pi_{\text{name}}(\sigma_{\text{age}=21}\text{Student})) \cup \pi_{\text{name}}\text{Faculty})$
- $\pi_{\text{s-id},\text{name},\text{f-id}}(\text{Student} \bowtie \text{Faculty})$
- 3.  $(\pi_{\text{name}}(\sigma_{\text{age}=21}\text{Student})) (\pi_{\text{name}}(\sigma_{\text{major}=\text{"CS"}}\text{Student}))$

# Answers for a Domain Relational Calculus Expression

$$\{x_1:A_1, x_2:A_2, ..., x_n:A_n \mid F(x_1, x_2, ..., x_n) \}$$

The query answer for a database d =  $\{r_1, r_2, ..., r_m\}$  over the database schema  $\Re = \{R_1, R_2, ..., R_m\}$  is a relation r over relation schema R with schema(R) =  $\{A_1, A_2, ..., A_n\}$  such that a tuple  $<v_1, v_2, ..., v_n>$  ∈ r iff

- 1. for all  $i \in \{1, 2, ..., n\}, v_i \in DOM(A_i)$  and
- if for all  $i \in \{1, 2, ..., n\}$ , we substitute  $v_i$  for  $x_i$  in F, then  $\langle v_1, v_2, ..., v_n \rangle$  satisfies F with respect to the database d.

CS 589, Principles of Database Systems, © 2016 David Maier

17

#### **Details**

- In our textbook, a domain calculus query is followed by the symbol "d" which is the database over which the query is being evaluated. Sometimes the query is followed by a set of relations, e.g., ({s, r})
- The definition of formulas and bound and free variables is essentially the same for domain calculus (as described in our textbook) and tuple calculus (as described in Ramakrishnan & Gehrke). I expect you to be able to read and understand this material.

CS 589, Principles of Database Systems, © 2016 David Maier

#### Satisfaction of a formula by a tuple

Let  $d = \{r_1, r_2, ..., r_m\}$  be a database over the database schema  $\mathcal{R}$ =  $\{R_1, R_2, ..., R_m\}$ . Given a query  $\{x_1: A_1, x_2: A_2, ..., x_n: A_n \mid F(x_1, x_2, ..., x_n) \}$ 

a tuple  $<v_1, \ v_2, \ ..., \ v_n>$  satisfies the formula F with respect to d, if for all  $i\in\{1,\ 2,\ ...,\ n\},\ v_i\in DOM(A_i)$  and one of the following is satisfied:

- If F is the atomic formula  $R(y_1, y_2, ..., y_k)$  then  $R \in \mathcal{R}$  and the tuple t with  $v_i$  substituted for each variable  $y_i$  satisfies  $t \in r$  where r is the relation over R in d.
- 2. If F is the atomic formula  $x_i = y_j$ , then  $v_i = v_j$  is true where  $v_i$  is substituted for  $x_i$  and either  $y_j$  is a variable and  $v_j$  is substituted for it or  $y_i$  is a constant and  $v_i = y_i$ .
- If F is the formula (G), then  $\langle v_1, v_2, ..., v_n \rangle$  satisfies the formula F if  $\langle v_1, v_2, ..., v_n \rangle$  satisfies the formula G.

CS 589, Principles of Database Systems, © 2016 David Maier

19

# Satisfaction (cont.)

- If F has the form  $\neg F$ ,  $F_1 \land F_2$ ,  $F_1 \lor F_2$ , or  $F_1 \Rightarrow F_2$ , then  $< \lor_1, \lor_2, ..., \lor_n >$  satisifes F according to the logical connectors.
- 5. If F is the formula  $\exists x_i$ :A (G( $x_1, x_2, ..., x_i, ..., x_n$ ), then  $< v_1, v_2, ..., v_{i-1}, v_{i+1}, ...v_n$ > satisifes F if there exists a constant  $v_i \in DOM(A)$  such than when  $v_i$  is substituted for  $x_i, < v_1, v_2, ..., v_{i-1}, v_i, v_{i+1}, ... v_n$ > satisfies G.
- 6. If F is the formula  $\forall x_i$ :A  $(G(x_1, x_2, ..., x_i, ..., x_n)$ , then  $\langle v_1, v_2, ..., v_{i-1}, v_{i+1}, ...v_n \rangle$  satisifes F if for all constants  $v_i \in DOM(A)$ , when  $v_i$  is subsituted for  $x_i, \langle v_1, v_2, ..., v_n \rangle$  satisifes G.

### Redo: Satisfaction of a formula by a tuple

Let  $d = \{r_1, r_2, ..., r_m\}$  be a database over the database schema  $\Re$ =  $\{R_1, R_2, ..., R_m\}$ . Given a query  $\{x_1: A_1, x_2: A_2, ..., x_n: A_n \mid F(x_1, x_2, ..., x_n) \}$ 

a tuple  $v=\langle v_1,v_2,...,v_n\rangle$  satisfies the formula F with respect to d, if for all  $i\in\{1,2,...,n\},v_i\in DOM(A_i)$  and one of the following is satisfied:

- If F is the atomic formula  $R_j(x_{i1}, x_{i2}, ..., x_{ik})$  then  $< v_{i1}, v_{i2}, ..., v_{ik}> \in r_j$ .
- i. If F is the atomic formula  $x_i = x_j$ , then  $v_i = v_j$  ii. If F is the atomic formula  $x_i = a$ , then  $v_i = a$ .
- If F is the formula (G), then v satisfies the formula F if v satisfies the formula G.

CS 589, Principles of Database Systems, © 2016 David Maier

21

# Redo: Satisfaction (cont.)

- If F has the form  $\neg F$ ,  $F_1 \land F_2$ ,  $F_1 \lor F_2$ , or  $F_1 \Rightarrow F_2$ , then v satisfies F according to the logical connectors. For example, v satisfies  $F_1 \lor F_2$  if v satisfies  $F_1$  or v satisfies  $F_2$ .
- If F is  $\exists x:A$  (G( $x_1, x_2, ..., x_n, x$ ), then  $\langle v_1, v_2, ..., v_n \rangle$  satisfies F if there exists a constant  $c \in DOM(A)$   $\langle v_1, v_2, ..., v_n, c \rangle$  satisfies G.
- If F is ∀x:A (G(x<sub>1</sub>, x<sub>2</sub>, ..., x<sub>n</sub>, x), then <v<sub>1</sub>, v<sub>2</sub>, ..., v<sub>n</sub>> satisifes F if for every constant c ∈ DOM(A)
   <v<sub>1</sub>, v<sub>2</sub>, ..., v<sub>n</sub>, c> satisfies G.
