Advanced Multimodal Machine Learning

Lecture 12.1: Multimodal Fusion and New Directions

Louis-Philippe Morency

Language Technologies Institute

Carnegie Mellon University

* Original version co-developed with Tadas Baltrusaitis

Lecture Objectives

- Recap: multimodal fusion
- Kernel methods for fusion
    - Multiple Kernel Learning
- New directions in multimodal machine learning
    - Representation
    - Alignment
    - Translation
    - Fusion
    - Co-Learning
- Recap of multimodal challenges

Quick Recap: Multimodal Fusion

Multimodal fusion

- Process of joining information from two or more modalities to perform a prediction

- Examples
  - Audio-visual speech recognition
  - Audio-visual emotion recognition
  - Multimodal biometrics
  - Speaker identification and diarization
 - Visual/Media Question answering

(a) answer-phone   (a) get-out-car   (a) fight-person

Multimodal Fusion

- Two major types
- Model Free
  - Early, late, hybrid
- Model Based
  - Neural Networks
  - Graphical models
  - Kernel Methods

Prediction

Fancy algorithm
Modality 1   Modality 2   Modality 3

Graphical Model: Learning Multimodal Structure

Modality-*private* structure

- Internal grouping of observations

Modality-*shared* structure
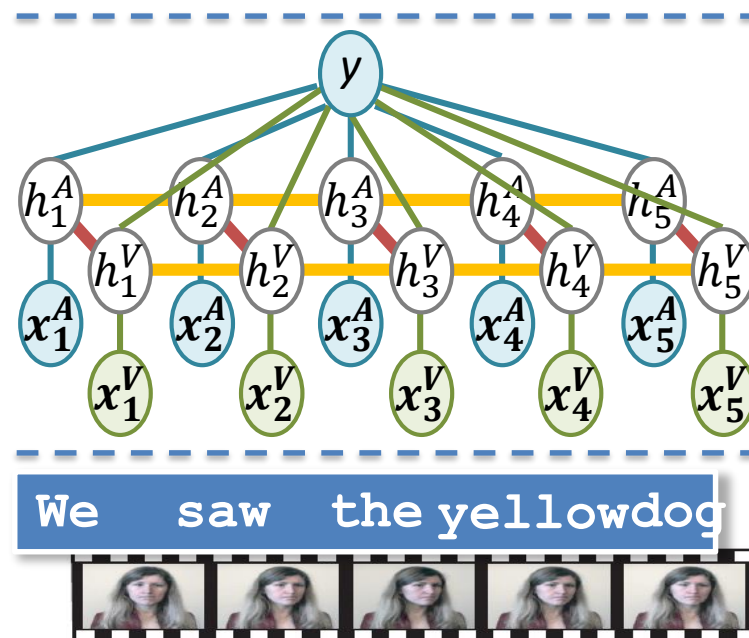

- Interaction and synchrony

Multi-view Latent Variable Discriminative Models

Modality-*private* structure

- Internal grouping of observations

Modality-*shared* structure

- Interaction and synchrony

$$p(y \mid \boldsymbol{x}^A, \boldsymbol{x}^V; \boldsymbol{\theta}) = \sum_{\boldsymbol{h}^A, \boldsymbol{h}^V} p(y, \boldsymbol{h}^A, \boldsymbol{h}^V \mid \boldsymbol{x}^A, \boldsymbol{x}^V; \boldsymbol{\theta})$$

➤ Approximate inference using loopy-belief

Language Technologies Institute

Carnegie Mellon University

Multimodal Fusion: Multiple Kernel Learning

What is a Kernel function?

- A kernel function: Acts as a similarity metric between data points

$$K(\boldsymbol{x}_i, \boldsymbol{x}_j) = \phi(\boldsymbol{x}_i)^T \phi(\boldsymbol{x}_j) = \langle \phi(\boldsymbol{x}_i), \phi(\boldsymbol{x}_j) \rangle, \text{ where } \phi : D \to Z$$

  - Kernel function performs an inner product in feature map space ϕ
  - Inner product (a generalization of the dot product) is often denoted as $\langle ., . \rangle$ in SVM papers
  - $\boldsymbol{x} \in \mathbb{R}^D$ (but not necessarily), but $\phi(\boldsymbol{x})$ can be in any space – same, higher, lower or even in an infinite dimensional space

Non-linearly separable data

Not linearly separable
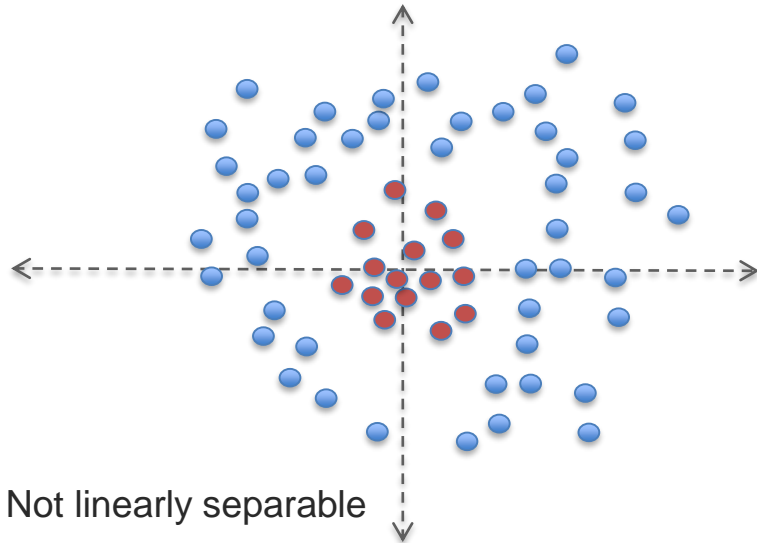

Same data, but now linearly separable

- Want to map our data to a linearly separable space
- Instead of x, want $\phi(x)$, in a separable space ($\phi(x)$ is a feature map)
- What if $\phi(x)$ is much higher dimensional? We do not want to learn more parameters and mapping could become very expensive

Language Technologies Institute

Carnegie Mellon University

Radial Basis Function Kernel (RBF)

- Arguably the most popular SVM kernel

- $K(x_i, x_j) = \exp - \frac{1}{2\sigma^2} \|x_i - x_j\|^2$

- $\phi(\boldsymbol{x}) = ?$

  - It is infinite dimensional and fairly involved, no easy way to actually perform the mapping to this space, but we know what an inner product looks like in it

- $\sigma = ?$

  - a hyperparameter

  - With a really low sigma the model becomes close to a KNN approach (potentially very expensive)

Some other kernels

- Other kernels exist
    - Histogram Intersection Kernel – good for histogram features
    - String kernels – specifically for text and sentence features
    - Proximity distribution kernel
    - (Spatial) pyramid matching kernel

Kernel CCA

- If we remember CCA it used only inner products in definitions when dealing with data, that means we can again use kernels

- We can now map into a high-dimensional non-linear space instead

$$(w_1^*, w_2^*) = \underset{w_1, w_2}{\operatorname{argmax}} \frac{w_1' \Sigma_{12} w_2}{\sqrt{w_1' \Sigma_{11} w_1 w_2' \Sigma_{22} w_2}} = \underset{w_1' \Sigma_{11} w_1 = w_2' \Sigma_{22} w_2 = 1}{\operatorname{argmax}} w_1' \Sigma_{12} w_2$$

$$(\alpha_1^*, \alpha_2^*) = \underset{\alpha_1, \alpha_2}{\operatorname{argmax}} \frac{\alpha_1' K_1 K_2 \alpha_2}{\sqrt{(\alpha_1' K_1^2 \alpha_2)(\alpha_1' K_2^2 \alpha_2)}} = \underset{\alpha_1' K_1^2 \alpha_1 = \alpha_2' K_2^2 \alpha_2 = 1}{\operatorname{argmax}} \alpha_1' K_1 K_2 \alpha_2,$$

[Lai et al. 2000]

Different properties of different signals

How do we deal with heterogeneous or multimodal data?

- The data of interest is not in a joint space so appropriate kernelsfor each modality might be different

Multiple Kernel Learning (MKL) is a way to address this

- Was popular for image classification and retrieval before deep learning approaches came around (winner of 2010 VOC challenge, ImageClef 2011 challenge)
- MKL - fell slightly out of favor when deep learning approaches became popular
- Still useful when large datasets are not available

Multiple Kernel Learning

- Instead of providing a single kernel and validating which one works optimize in a family of kernels (or different families for different modalities)
- Works well for unimodal and multimodal data, very little adaptation is needed

[Lanckriet 2004]

MKL in Unimodal Case

- Pick a family of kernels and learn which kernels are important for the classification case
- For example a set of RBF and polynomial kernels

MKL in Multimodal/Multiview Case

- Pick a family of kernels for each modality and learn which kernels are important for the classification case

- Does not need to be different modalities, often we use different views of the same modality (HOG, SIFT, etc.)

New Directions: Representation

Representation 1: Hash Function Learning

- We talked about coordinated representations, but mostly enforced "simple" coordination

- We can make embeddings more suitable for retrieval
   - Enforce a Hamming space (binary n-bit space)

[Cao et al. Deep visual-semantic hashing for cross-modal retrieval, KDD 2016]

Representation 2: Order-Embeddings

- We talked about coordinated representations, but mostly enforced "simple" coordination
    - Can we take it further?
- Replaces symmetric similarity

$$x \preceq y \text{ if and only if } \bigwedge_{i=1}^{N} x_i \geq y_i$$

- Enforce approximate structure when training the embedding

[Vendrov et al. Order-embeddings of images and language, ICLR 2016]

Carnegie Mellon University

Representation 3: Hierarchical Multimodal LSTM

- Attempts to model region-based representations using phrases rather than simply an overview sentence for the image

- Uses these region based phrases to hierarchically build sentences
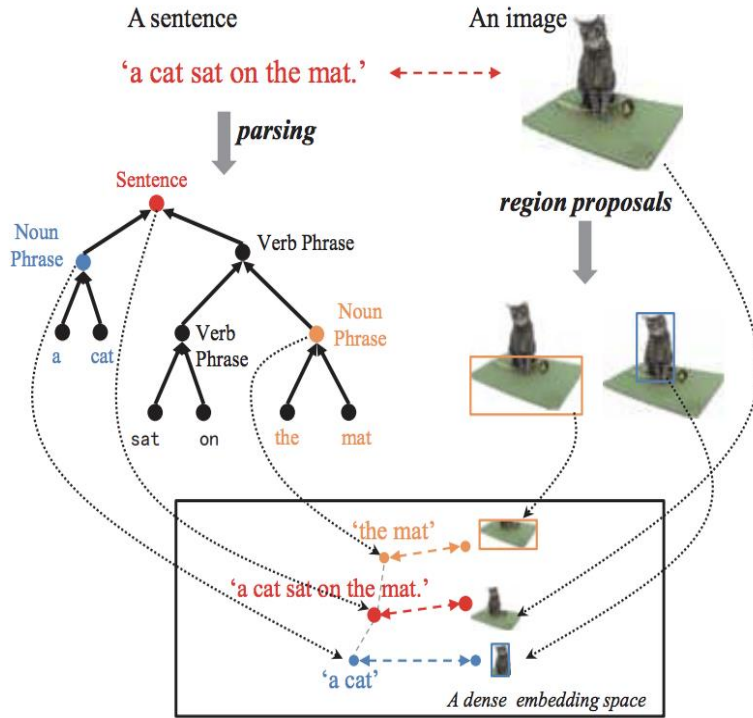

General Image Captioning:

- 'A man is standing in front of towers.'

Region-oriented, detailed, and phrase-level Captioning:

- 'a man with a blue hat and sunglasses'
- 'a girl in red jacket and black dress'
- 'several white towers with golden spire'

Niu, Zhenxing, et al. "Hierarchical multimodal lstm for dense visual-semantic embedding." *Computer Vision (ICCV), 2017 IEEE International Conference on*. IEEE, 2017.

Language Technologies Institute

Carnegie Mellon University

Representation 3: Hierarchical Multimodal LSTM

Multimodal Embedding
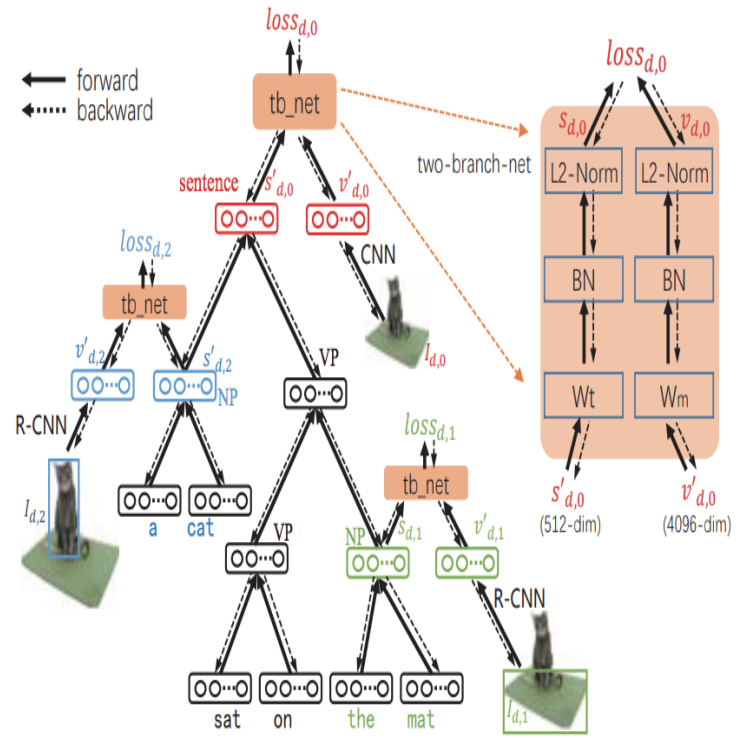

HM-LSTM

Niu, Zhenxing, et al. "Hierarchical multimodal lstm for dense visual-semantic embedding." *Computer Vision (ICCV), 2017 IEEE International Conference on*. IEEE, 2017.

Representation 4: Multimodal VAE (MVAE)

- Introduce a multimodal variational autoencoder (MVAE) with a new training paradigm that learns a joint distribution and is robust to missing data

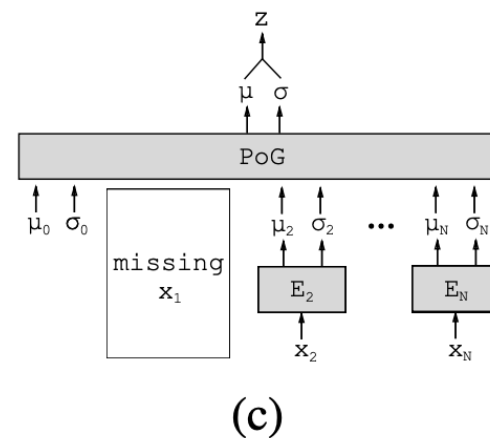

(a)　　(b)　　(c)

[Wu, Mike, and Noah Goodman. "Multimodal Generative Models for Scalable Weakly-Supervised Learning.", NIPS 2018]

Language Technologies Institute

Carnegie Mellon University

Representation 4: Multimodal VAE (MVAE)

- Transform unimodal datasets into "multi-modal" problems by treating labels as a second modality

$z{\sim}p(z)$ $z{\sim}p(z|x_2 = 5)$ $z{\sim}p(z)$ $z{\sim}p(z|x_2 = ankle\ boot)$

[Wu, Mike, and Noah Goodman. "Multimodal Generative Models for Scalable Weakly-Supervised Learning.", NIPS 2018]

Representation 5: Multilingual Representations

Goal: map image and its descriptions (not translations) in both languages close to each other.
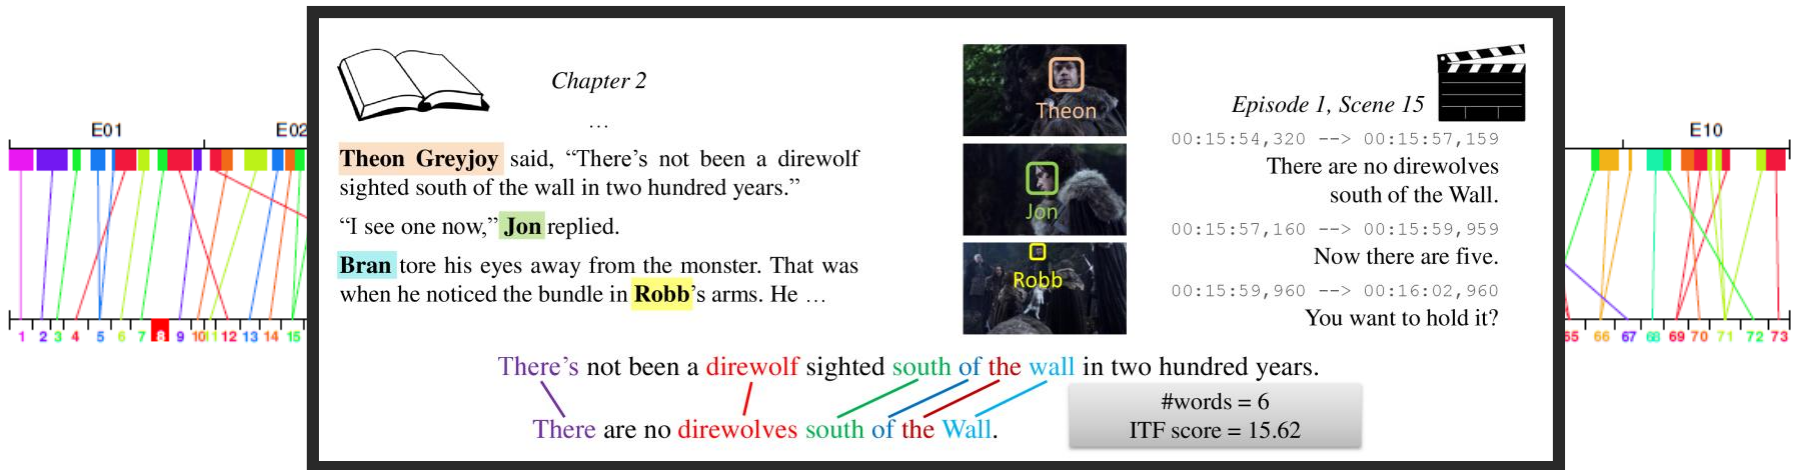

[Gella et al. " Image Pivoting for Learning Multilingual Multimodal Representations", ACL 2017]

New Directions: Alignment

Language Technologies Institute

Carnegie Mellon University

Alignment 1: Books to scripts/movies

- Aligning very different modalities
- Books to scripts/movies

- Hand-crafted similarity based approach

[Tapaswi et al. Book2Movie: Aligning Video scenes with Book chapters, CVPR 2015]
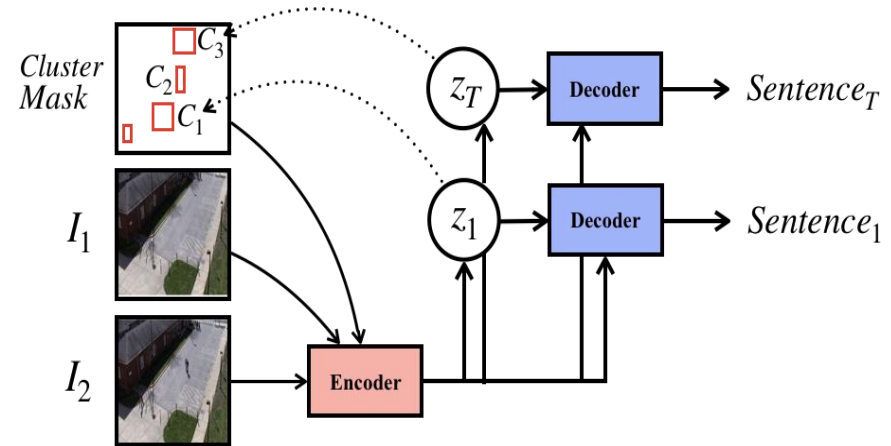

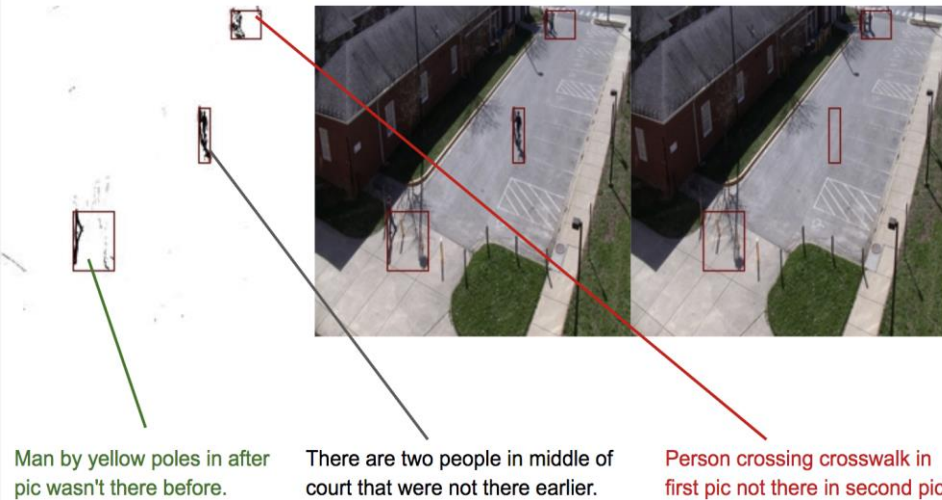

Alignment 2: Books to scripts/movies

- Aligning very different modalities
- Books to scripts/movies

When I think of my wife I always think of her head.
I picture cracking her lovely skull unspooling her brains trying to get answers.

- Supervision based approach

[Zhu et al. Aligning Books and Movies: Towards Story-like Visual Explanations by Watching Movies and Reading Books, ICCV 2015]

Alignment 3: Spot-The-Diff

Man by yellow poles in after pic wasn't there before.

There are two people in middle of court that were not there earlier.

Person crossing crosswalk in first pic not there in second pic.

- '*Spot-the-diff*': a new task and a dataset for succinctly describing all the differences between two similar images.
- Proposes a new model that captures visual salience through a latent alignment between clusters of differing pixels and output sentences.

[Jhamtani and Berg-Kirkpatrick. Learning to Describe Differences Between Pairs of Similar Images., EMNLP 2018]

Alignment 4: Textual Grounding
A woman in a green shirt is getting ready to throw her bowling ball down the lane...

Two women wearing hats covered in flowers are posing.

Young man wearing a hooded jacket sitting on snow in front of mountain area.

second bike from right in front

painting next to the two on the left

person all the way to the right

[Yeh, Raymond, et al. "Interpretable and globally optimal prediction for textual grounding using image concepts.", NIPS 2017.]
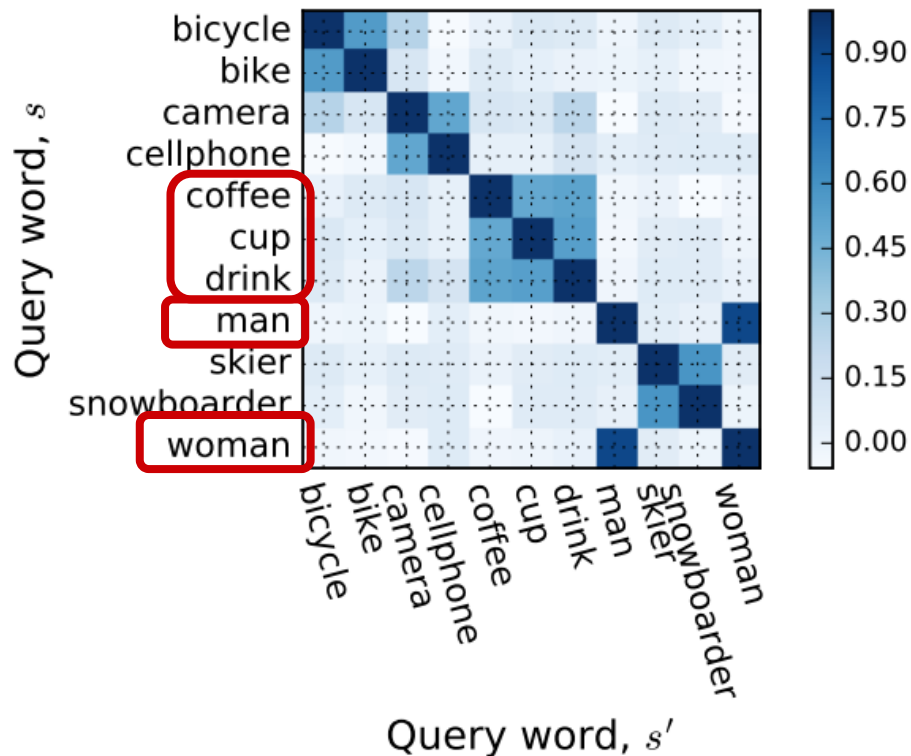

Alignment 4: Textual Grounding

- Formulate the bounding box prediction as an energy minimization
  - The energy function is defined as a linear combination of a set of "image concepts" $\phi_c(x, w_r) \in \mathbb{R}^{W \times H}$

Word priors

[Yeh, Raymond, et al. "Interpretable and globally optimal prediction for textual grounding using image concepts.", NIPS 2017.]

Language Technologies Institute

Carnegie Mellon University

Alignment 4: Textual Grounding

Word-word relationship

$$\cos(w_s, w_{s'})$$
$$w_s = [w_{s,1}; w_{s,1}; \ldots; w_{s,|C|}]$$

[Yeh, Raymond, et al. "Interpretable and globally optimal prediction for textual grounding using image concepts.", NIPS 2017.]

Language Technologies Institute

Carnegie Mellon University
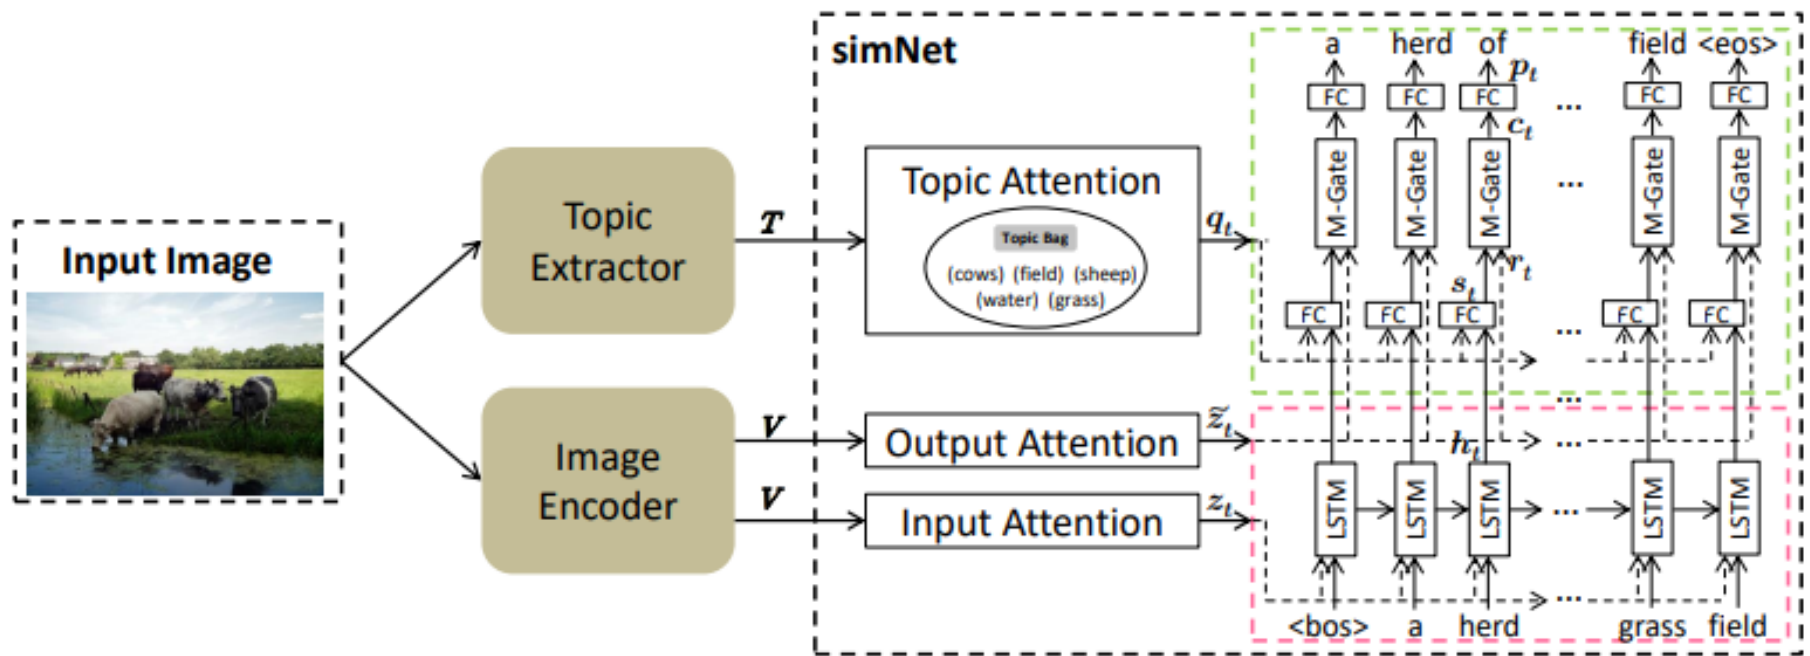

Alignment 5: Comprehensive Image Captions

- Merging attention from text and visual modality for image captioning

- Strike a balance between details (visual driven) and coverage of objects (text/topic driven)
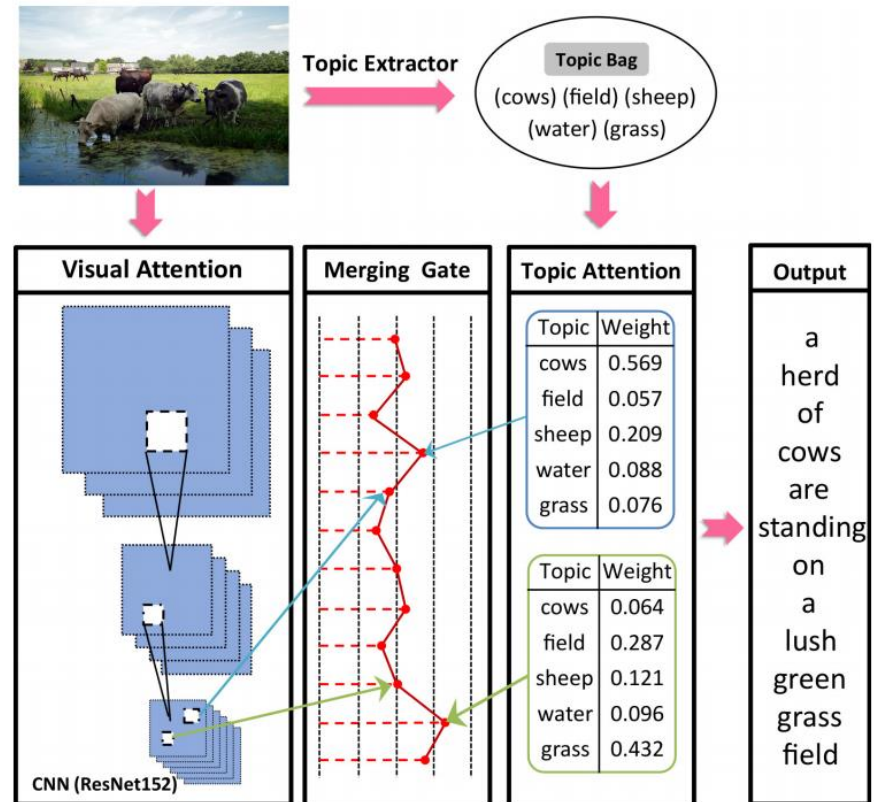

[Liu et al. simNet: Stepwise Image-Topic Merging Network for Generating Detailed and Comprehensive Image Captions, 2018]

Alignment 5: Comprehensive Image Captions

- Merging attention from text and visual modality for image captioning

[Liu et al. simNet: Stepwise Image-Topic Merging Network for Generating Detailed and Comprehensive Image Captions, 2018]
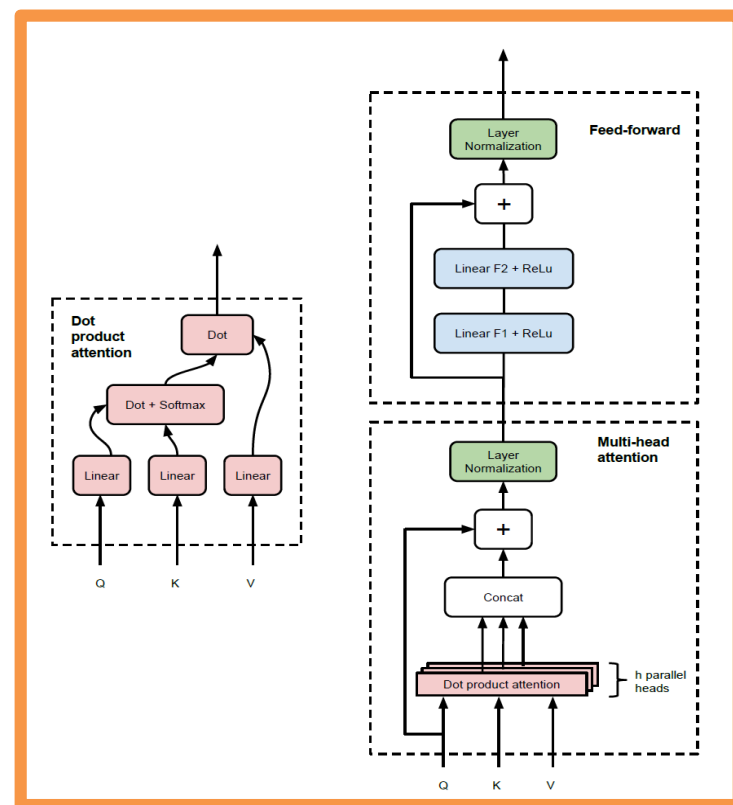

New Directions: Fusion
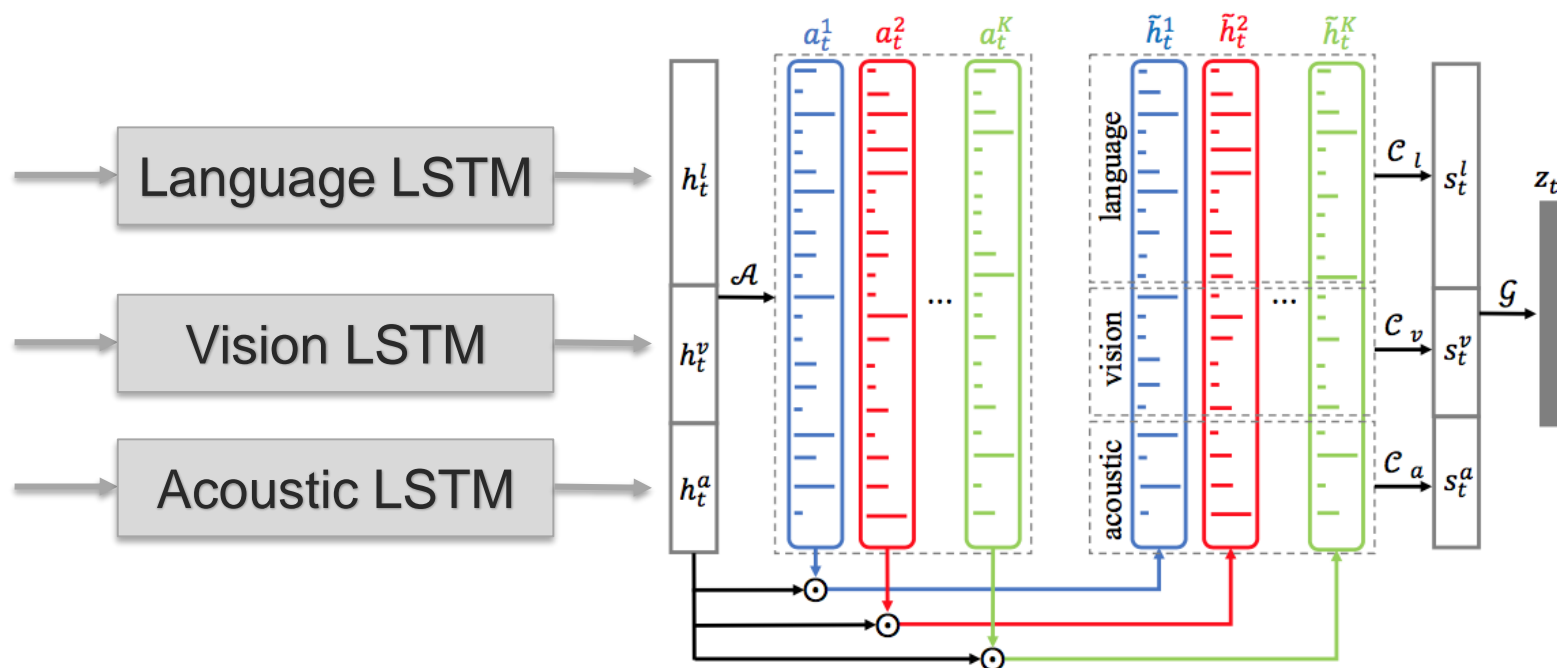

Fusion 1a: Multi-Head Attention for AVSR

Multi-head Attention

Afouras, Triantafyllos, Joon Son Chung, Andrew Senior, Oriol Vinyals, and Andrew Zisserman. "Deep audio-visual speech recognition." *arXiv preprint arXiv:1809.02108* (Sept 2018).
Fusion 1b: Fusion with Multiple Attentions

- Modeling Human Communication – Sentiment, Emotions, Speaker Traits

[Zadeh et al., Human Communication Decoder Network for Human Communication Comprehension, AAAI 2018]

Language Technologies Institute

Carnegie Mellon University

Fusion 2: Memory-Based Fusion

[Zadeh et al., Memory Fusion Network for Multi-view Sequential Learning, AAAI 2018]
Fusion 3: Relational Questions

- Aims to improve relational reasoning for Visual Question Answering

Original Image:

Non-relational question:
What is the size of the brown sphere?

Relational question:
Are there any rubber things that have the same size as the yellow metallic cylinder?

- Current deep learning architectures – unable to capture reasoning capabilities on their own

- Proposes a Relation Network (RN) that augments CNNs for better reasoning

Santoro, A., Raposo, D., Barrett, D. G., Malinowski, M., Pascanu, R., Battaglia, P., & Lillicrap, T. (2017). A simple neural network module for relational reasoning. In *Advances in neural information processing systems* (pp. 4967-4976).

Fusion 3: Relational Questions
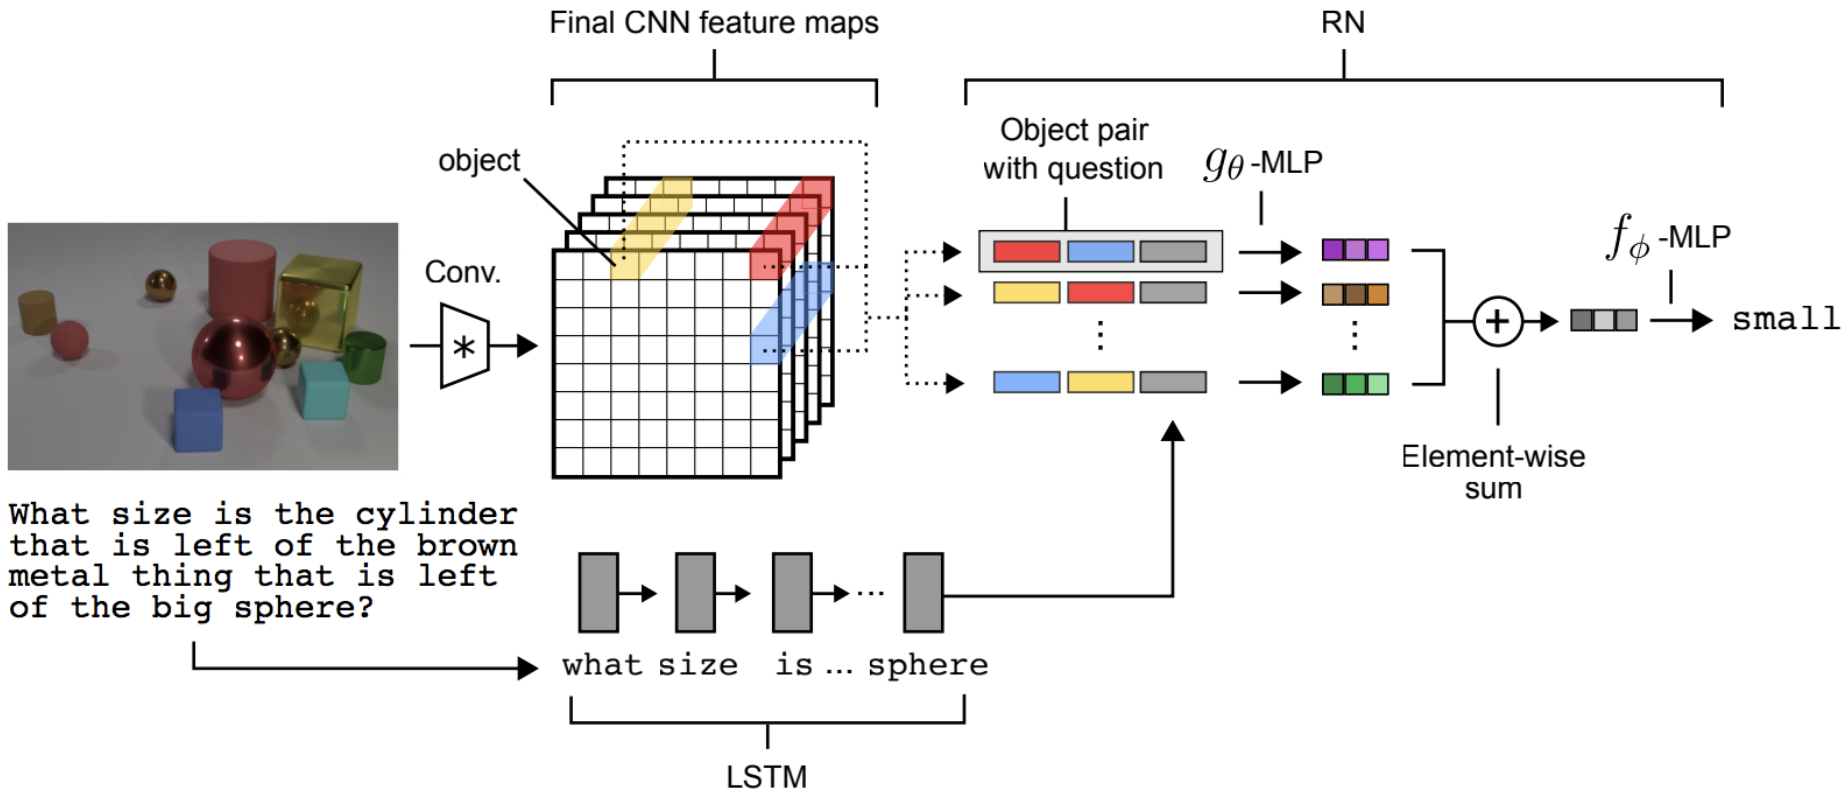

Fusion 4: Structured Prediction

- Scene-graph prediction: The output structure is invariant to specific permutations.

- The paper describe a model that satisfies the permutation invariance property, and achieve state-of-the-art results on the competitive Visual Genome benchmark

[Herzig et al. Mapping Images to Scene Graphs with Permutation-Invariant Structured Prediction, NIPS 2018]

Fusion 5: Recurrent Multimodal Interaction

The same LSTM module strides across entire image / feature map of image, acting as conv kernel

Input image

Segmentation mask

giraffe   on   right

[Liu et al. Recurrent Multimodal Interaction for Referring Image Segmentation, 2017]

Language Technologies Institute

Carnegie Mellon University

New Directions: Translation

Translation 1: Visually indicated sounds

- Sound generation!

[Owens et al. Visually indicated sounds, CVPR, 2016]

Translation 2: The Sound of Pixels

- Propose a system that learns to localize the sound sources in a video and separate the input audio into a set of components coming from each object by leveraging unlabeled videos.

[Zhao, Hang, et al. "The sound of pixels.", ECCV 2018]   https://youtu.be/2eVDLEQIKD0

Language Technologies Institute   Carnegie Mellon University
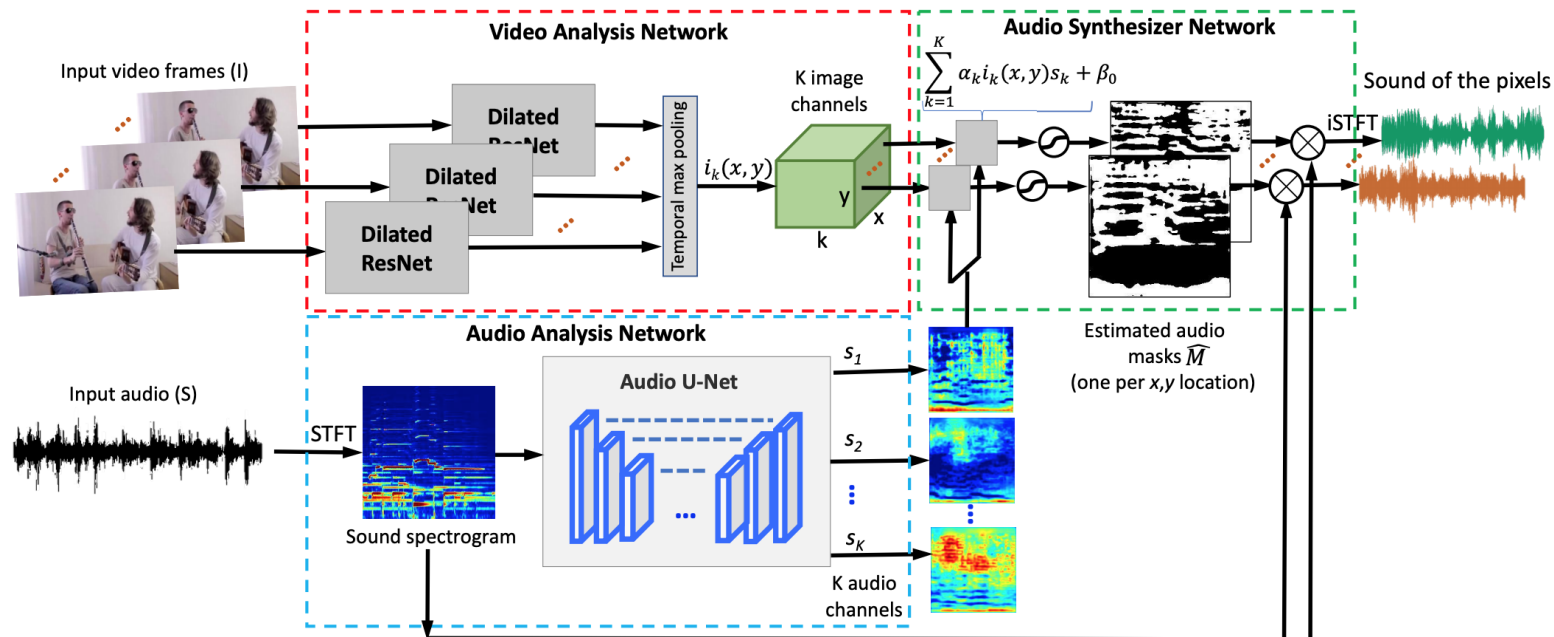

# Translation 2: The Sound of Pixels

- Trained in a **self-supervised** manner by learning to separate the sound source of a video from the audio mixture of multiple videos conditioned on the visual input associated with it.

[Zhao, Hang, et al. "The sound of pixels.", ECCV 2018]

Language Technologies Institute

Carnegie Mellon University
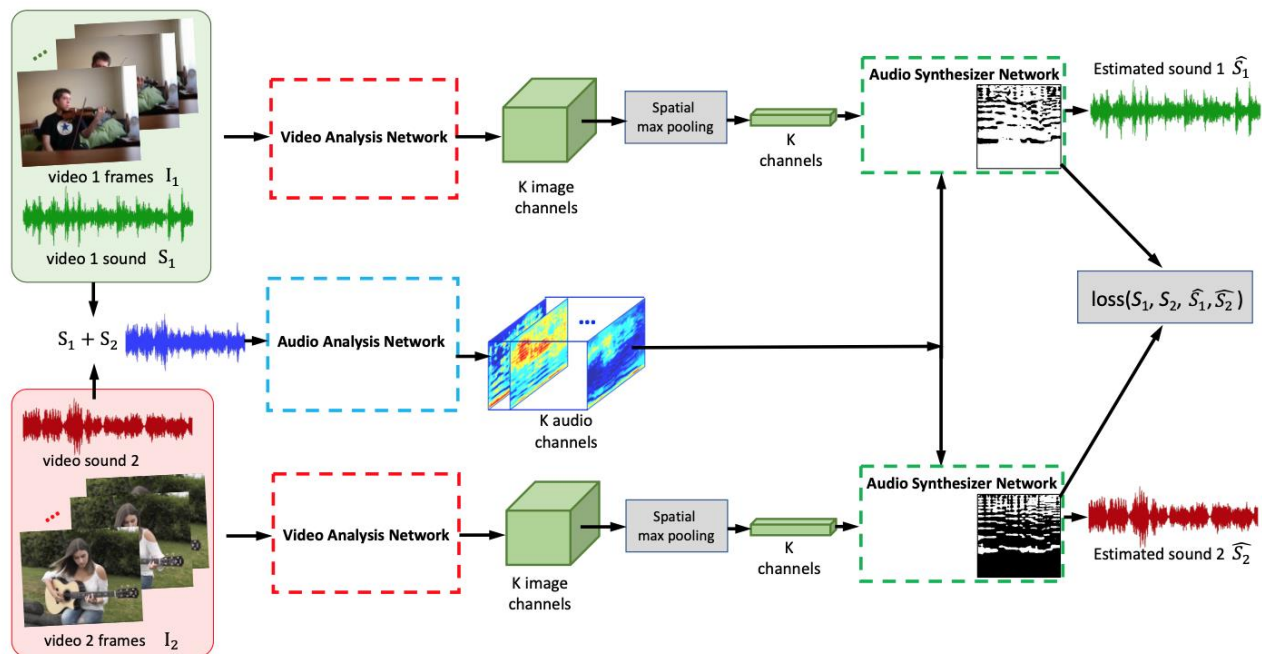

Translation 3: Learning-by-asking (LBA)

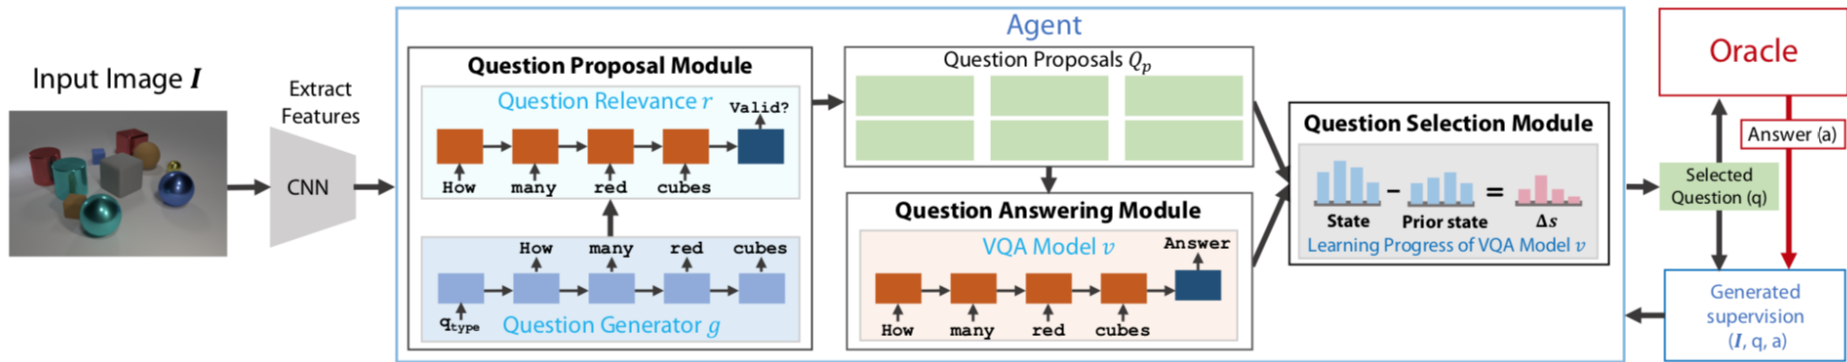

- an **agent** interactively learns by asking questions to an **oracle**
- standard VQA training has a fixed dataset of questions
- in LBA the agent has the potential to learn more quickly by asking "good" questions (like a bright student in a class)

[Misra et al. "Learning by Asking Questions", CVPR 2018]

Translation 3: Learning-by-asking (LBA)

Training:
- Given on the input image the model decides what questions to ask
- Answers are obtained by human supervised oracle

Testing:
- LBA is evaluated exactly like VQA

[Misra et al. "Learning by Asking Questions", CVPR 2018]

Translation 4: Navigation

- Goal prediction
    - Highlight the goal location by generating a probability distribution over the environment panoramic image

- Interpretability
    - Explicit goal prediction modeling makes the approach more interpretable

After reaching the hydrant head towards the blue fence and pass towards the right side of the well.
Put the cereal, the sponge, and the dishwashing soap into the cupboard above the sink.

[Misra et al. Mapping Instructions to Actions in 3D Environments with Visual Goal Prediction, EMNLP 2018]

Translation 4: Navigation
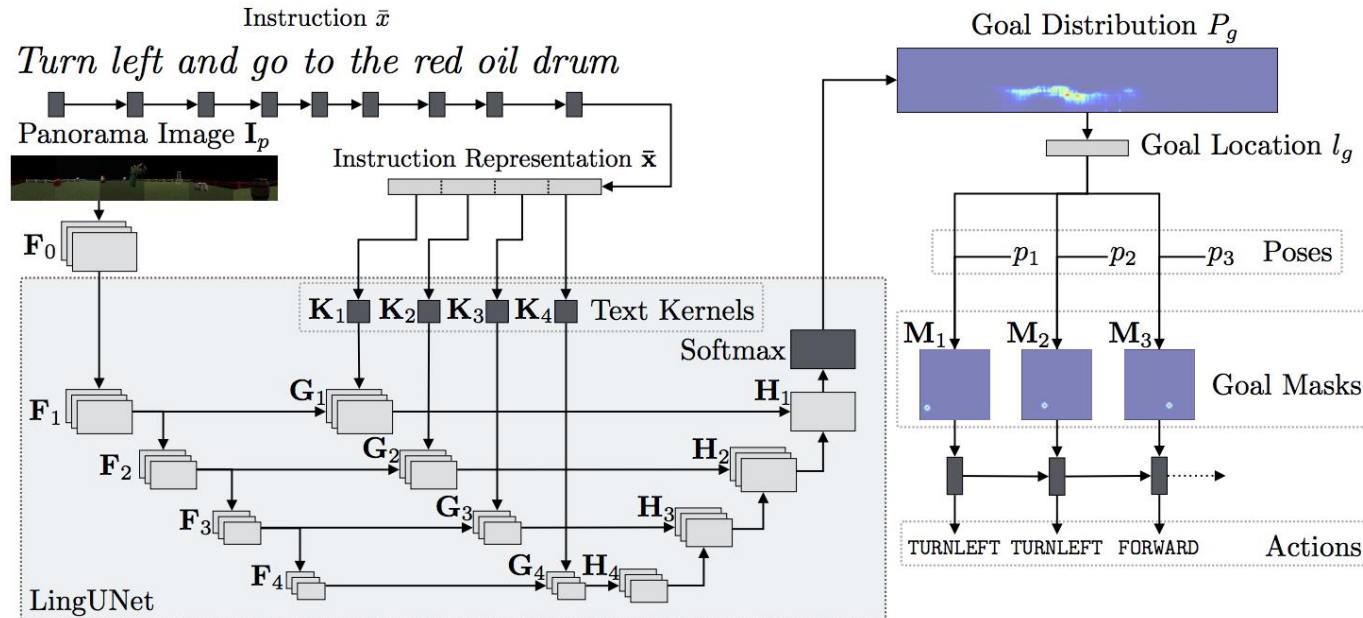

- The paper proposes to decompose instruction execution into: 1) goal prediction and 2) action generation

[Misra et al. Mapping Instructions to Actions in 3D Environments with Visual Goal Prediction, EMNLP 2018]

Translation 5: Explanations for VQA and ACT

Pointing and Justification Architecture
- **Answering Model**: predicts an answer given the image and the question
- **Multimodal Explanation Model**: generates visual and textual explanations given the answer, question, and image

[Park et al. "Multimodal Explanations: Justifying Decisions and Pointing to the Evidence", CVPR 2018]

Translation 5: Explanations for VQA and ACT

VQA-X:

Q: Is this a zoo?

A: No — ... because the zebras are standing in a green field.

A: Yes — ... because there are animals in an enclosure.
Q: Is the water calm?

A: No — ... because there are waves and foam.

A: Yes — ... because there are no waves and you can see the reflection of the sun.

ACT-X:

The activity is

A: Mowing Lawn — ... because he is kneeling in the grass next to a lawn mower.
A: Mowing Lawn — ... because he is pushing a lawn mower over a grassy lawn.

The activity is

A: Mountain Biking — ... because he is riding a bicycle down a mountain path in a mountainous area.

A: Road Biking — ... because he is wearing a cycling uniform and riding a bicycle down the road.

[Park et al. "Multimodal Explanations: Justifying Decisions and Pointing to the Evidence", CVPR 2018]

New Directions: Co-Learning

Co-learning 1: Regularizing with Skeleton Seqs

- Better unimodal representation by regularizing using a different modality

Non parallel data!

[B. Mahasseni and S. Todorovic, "Regularizing Long Short Term Memory with 3D Human-Skeleton Sequences for Action Recognition," in CVPR, 2016]

Co-Learning 2: Multimodal Cyclic Translation

Sentiment

Co-learning 3: Taskonomy
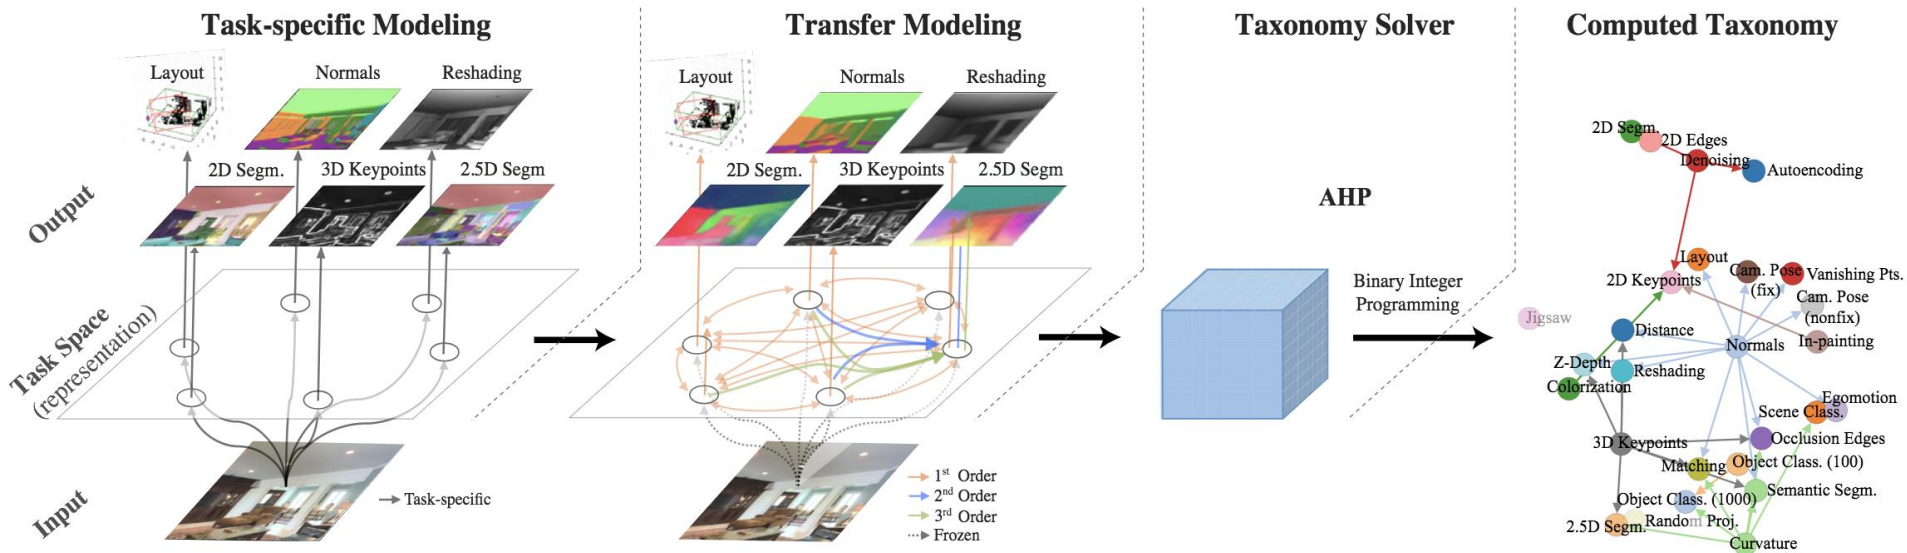

Process overview. The steps involved in creating the taxonomy.

Zamir, Amir R., et al. "Taskonomy: Disentangling Task Transfer Learning." *Proceedings of the IEEE Conference on Computer Vision and Pattern Recognition*. 2018.

Co-learning 4: Associative Multichannel Autoencoder

- Learning representation through fusion and translation
- Use associated word prediction to address data sparsity
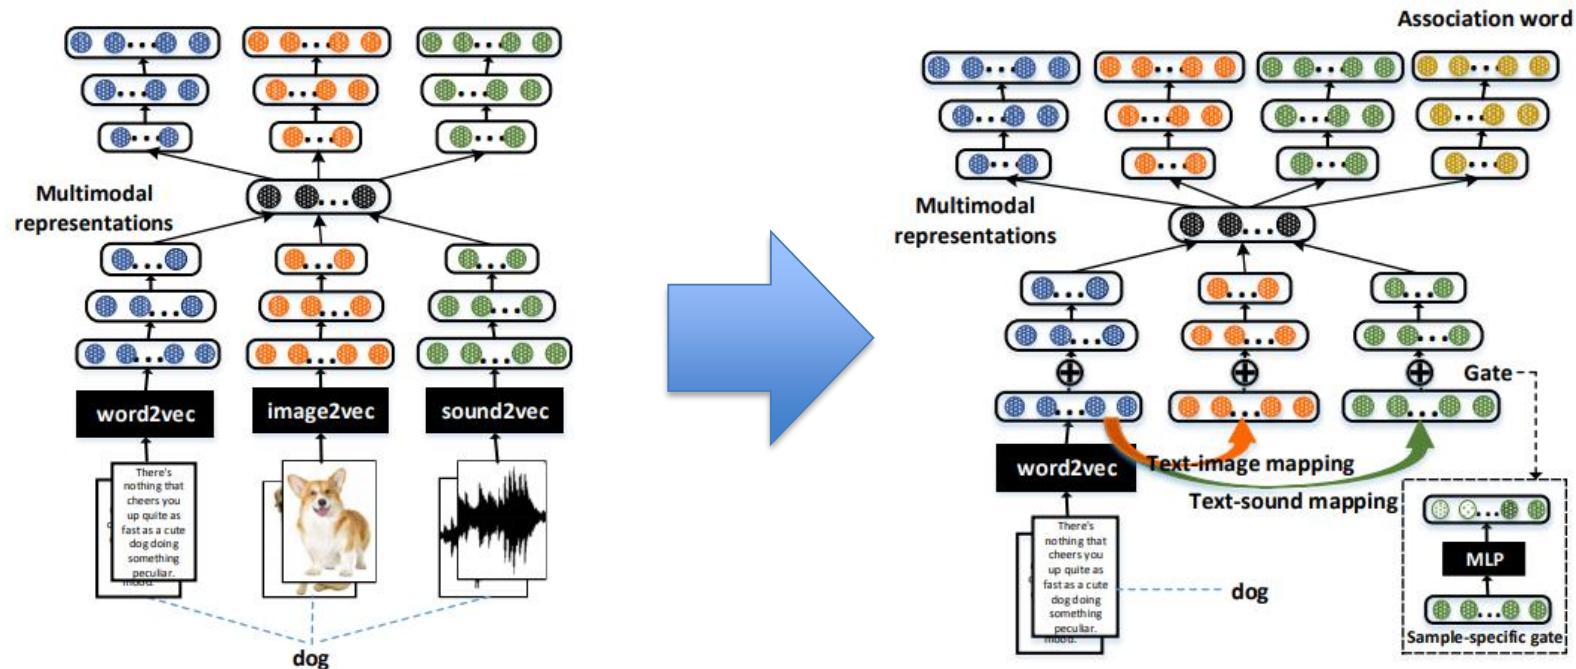

[Wang et al. Associative Multichannel Autoencoder for Multimodal Word Representation, 2018]

- Grounding language in vision, sound, and **smell**

t_3
t_n

Fancy algorithm

t_4
t_5
t_n

A **Explicit Alignment**

The goal is to directly find correspondences between elements of different modalities

B **Implicit Alignment**

Uses internally latent alignment of modalities in order to better solve a different problem

Language Technologies Institute

Carnegie Mellon University

Core Challenge 3: Fusion

Definition: To join information from two or more modalities to perform a prediction task.

Language Technologies Institute
Carnegie Mellon University
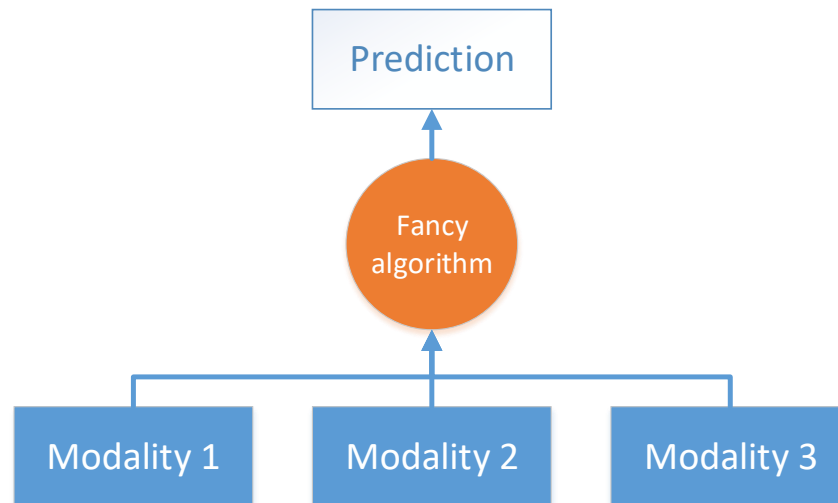

Core Challenge 4: Translation

Definition: Process of changing data from one modality to another, where the translation relationship can often be open-ended or subjective.

Challenge 5 – Co-learning

- How can one modality help learning in another modality?
  - One modality may have more resources
  - Bootstrapping or domain adaptation
  - Zero-shot learning
- How to alternate between modalities during learning?
  - Co-training (term introduced by Avrim Blum and Tom Mitchell from CMU)
- Transfer learning
