Multimodal Machine Learning

Lecture 4.1: Multimodal Representations

Louis-Philippe Morency

* Original version co-developed with Tadas Baltrusaitis

Objectives of today's class

- Unsupervised representation learning
 - Restricted Boltzmann Machines
 - Autoencoders
 - Deep Belief Nets, Stacked autoencoders
- Multi-modal representations
 - Coordinated vs. joint representations
 - Multimodal Deep Boltzmann Machines
 - Deep Multimodal autoencoders
 - Tensor Fusion representation
 - Low-rank fusion representations

Administrative Stuff

Upcoming Schedule

- First project assignment:
 - Proposal presentation (10/1 and 10/3)
 - First project report (Sunday 10/6)
- Midterm project assignment
 - Midterm presentations (11/5 and 11/7)
 - Midterm report (Sunday 11/10)
- Final project assignment
 - Final presentation (12/3 & 12/5)
 - Final report (Sunday 12/8)

Proposal Presentation

- 5 minutes (about 5-8 slides)
- All team members should be involved in the presentation
- Will receive feedback from instructors and other students
 - 1-2 minutes between presentations reserved for written feedback
- Main presentation points
 - Research problem and motivation
 - Prior work
 - New research ideas
- You need to submit a copy of your slides (PDF or PPT)
 - Deadline: Friday 10/4 (on Gradescope)

Project Proposal Report

- Part 1 (updated version of your pre-proposal)
 - **Introduction:**
 - Describe and motivate the research problem
 - Define in generic terms the main computational challenges
 - **Experimental Setup:**
 - Describe the dataset(s) you are planning to use for this project.
 - Describe the input modalities and annotations available in this dataset.

Project Proposal Report

- Part 2
 - **Related Work:**
 - Include 12-15 paper citations which give an overview of the prior work
 - Present in more details the 3-4 research papers most related to your work
 - **New Research Ideas**
 - Describe your specific challenges and/or research hypotheses
 - Highlight the novel aspect of your proposed research

Project Proposal Report

- Part 3
 - **Language Modality Exploration:**
 - Explore neural language models on your dataset (e.g., using Keras)
 - Train at least two different language models (e.g., using SimpleRNN, GRU or LSTM) on your dataset and compare their perplexity.
 - Include qualitative examples of successes and failure cases.
 - **Visual Modality Exploration:**
 - Explore pre-trained Convolutional Neural Networks (CNNs) on your dataset
 - Load a pre-existing CNN model trained for object recognition (e.g., VGG-Net) and process your test images.
 - Visualize the visual representations (using t-sne visualization) with overlaid class labels with different colors.

Unsupervised representation learning

Unsupervised learning

- We have access to $X = \{x_1, x_2, \dots, x_n\}$ and not $Y = \{y_1, y_2, \dots, y_n\}$
- Why would we want to tackle such a task
- 1. Extracting interesting information from data
 - Clustering
 - Discovering interesting trends
 - Data compression
- 2. Learn better representations

Unsupervised representation learning

- Force our representations to better model input distribution
 - Not just extracting features for classification
 - Asking the model to be good at representing the data and not overfitting to a particular task
 - Potentially allowing for better generalizability
- Use for initialization of supervised task, especially when we have a lot of unlabeled data and much less labeled examples

Restricted Boltzmann Machines

Restricted Boltzmann Machine (RBM)

- Undirected Graphical Model
- A generative rather than discriminative model
- Connections from every hidden unit to every visible one
- No connections across units (hence Restricted), makes it easier to train and do inference on

[Smolensky, Information Processing in Dynamical Systems: Foundations of Harmony Theory, 1986]

Restricted Boltzmann Machine (RBM)

$$p(\mathbf{x}, \mathbf{h}; \theta) = \frac{\exp(-E(\mathbf{x}, \mathbf{h}; \theta))}{\sum_{\mathbf{x}'} \sum_{\mathbf{h}'} \exp(-E(\mathbf{x}', \mathbf{h}'; \theta))} \quad \leftarrow \text{Partition function } Z$$

- Hidden and visible layers are binary (e.g. $\mathbf{x} = \{0, \dots, 1, 0, 1\}$)
- Model parameters $\theta = \{W, \mathbf{b}, \mathbf{a}\}$

$$E = -\mathbf{x}W\mathbf{h} - \mathbf{b}\mathbf{x} - \mathbf{a}\mathbf{h}$$

$$E = -\underbrace{\sum_i \sum_j w_{i,j} x_i h_j}_{\text{Interaction term}} - \underbrace{\sum_i b_i x_i}_{\text{Bias terms}} - \underbrace{\sum_j a_j h_j}_{\text{Bias terms}}$$

Boltzmann Machine

$$p(\mathbf{x}, \mathbf{h}; \theta) = \frac{\exp(-E(\mathbf{x}, \mathbf{h}; \theta))}{\sum_{\mathbf{x}'} \sum_{\mathbf{h}'} \exp(-E(\mathbf{x}', \mathbf{h}'; \theta))}$$

- Hidden and visible layers are binary (e.g. $\mathbf{x} = \{0, \dots, 1, 0, 1\}$)

Statistical Mechanics: Boltzmann Distribution

[also called Gibbs measure]

$$p(\mathbf{h}; \theta) = \frac{\exp(-E(\mathbf{h}; \theta)/kT)}{\sum_{\mathbf{h}'} \exp(-E(\mathbf{h}'; \theta)/kT)}$$

- probability distribution that gives the probability that a system will be in a certain state $\mathbf{h}$

$E(\mathbf{h}; \theta)$: Energy of state $\mathbf{h}$

k : Boltzmann constant

T : Thermodynamic temperature

RBM inference (have a trained θ)

- For inference
 - $p(h_j = 1 | \mathbf{x}; \theta) = \sigma(\sum_i x_i w_{ij} + a_j)$,
 - $p(x_i = 1 | \mathbf{h}; \theta) = \sigma(\sum_j h_j w_{ij} + b_i)$
 - derived from the joint probability definition
- Conditional inference is easy and of sigmoidal form
 - Given a trained model θ and an observed value x can easily infer h
 - Given a trained model θ and an hidden layer value h can easily infer x
- Need to sample as we get probabilities rather than values

RBM training (learning the θ)

- Want to have a model that leads to good likelihood of training data
- First express the data likelihood (through marginal probability):
 - $p(\mathbf{x}; \theta) = \frac{\sum_{\mathbf{h}} \exp(-E(\mathbf{x}, \mathbf{h}; \theta))}{Z} \quad Z = \sum_{\mathbf{x}} \sum_{\mathbf{h}} \exp(-E(\mathbf{x}, \mathbf{h}; \theta))$
- Want to optimize:
 - $\operatorname{argmin}_{\theta} \left[\sum_t -\log(p(\mathbf{x}^{(t)}; \theta)) \right]$, where t is a data sample
 - sum across all samples
 - minimizing negative log likelihood instead of maximizing the likelihood
- To Approximate computation of model term using Contrastive Divergence
 - Based on Markov Chain Monte Carlo (Gibbs) sampling

[G. Hinton, Training Products of Experts by Minimizing Contrastive Divergence, 2002]

See <http://www.iro.umontreal.ca/~lisa/twiki/bin/view.cgi/Public/DBNEquations> for more details

RBM extensions

- So far have only modeled binary input and hidden states
- Gaussian-Bernoulli RBM allows for real value modeling
 - Changes the inference and training only very slightly
 - Visible units are modeled as real values (under a Gaussian distribution), but hidden units are still binary
 - [Hinton and Salakhutdinov, Reducing the Dimensionality of Data with Neural Networks, 2006]
- Only requires a small change in some of the equations
- Can also introduce sparsity in hidden layers (sometimes helps)
 - [Lee et al., Sparse deep belief net model for visual area V2, 2007]

Examples of what the model learns

MNIST data

Learned W terms for each hidden unit

Deep Restricted Boltzmann Machines (DBMs)

- Can stack RBMs together to lead to deep versions of them
- The visible layer can be binary, Gaussian or Bernoulli
- Training fully end to end is very difficult
- Greedy layer-wise training
- Combine the RBMs layer by layer

Deep Belief Networks (DBN)

- To make it easier used Deep Belief Networks
 - Actually came before Deep RBMs
- Simplifies model training
- Turn the undirected model to directed one, making the interaction simpler

For more details see [Salakhutdinov and Hinton, Deep Boltzmann Machines, 2009]

Autoencoders

Autoencoders – an alternative to RBM

- What does auto mean?
 - Greek for self – self encoding
- Feed forward network intended to reproduce the input
- Two parts encoder/decoder
 - $x' = f(g(x))$ – score function
 - g - encoder
 - f - decoder

Autoencoders

- Mostly follows Neural Network structure
 - Typically a matrix multiplication followed by a nonlinearity (e.g sigmoid)
- Activation will depend on type of x
 - Sigmoid for binary
 - Linear for real valued
- Often we use *tied weights* to force the sharing of weights in encoder/decoder
 - $W^* = W^T$
- word2vec is actually a bit similar to an autoencoder (except for the auto part)

Loss function

- Any differentiable similarity function
- Cross-entropy for binary x
 - $L = -\sum_k (x_k \log(x'_k) + (1 - x_k) \log(1 - x'_k))$
- Euclidean for real valued x
 - $L = \frac{1}{2} \sum_k (x_k - x'_k)^2$
- Cosine similarity etc.
- Depends on the data being modeled

Learning

- To learn the model parameters (W^* , W), we use back-propagation
- In case of Euclidean (with linear act) and Cross-entropy (with sigmoid act), we just have $(x' - x)$ error to propagate
- If we're using *tied* weights, gradients need to be summed (like back propagation through time in RNN)
- Can use batch/stochastic gradient descent as before

Denoising autoencoder

- Simple idea
 - Add noise to input x but learn to reconstruct original
- Leads to a more robust representation and prevents copying
- Learns what the relationship is to represent a certain x
- Different noise added during each epoch

Autoencoder vs denoising autoencoder

- MNIST data (as before)

Qualitatively denoising autoencoder leads to more meaningful features

Stacked autoencoders

- Can stack autoencoders as well
- Each encoding unit has a corresponding decoder
- As before, inference is feedforward, but now with more hidden layers

Stacked autoencoders

- Greedy layer-wise training
- Start with training first layer
 - Learn to encode x to h_1 and to decode x from h_1
 - Use backpropagation

Stacked autoencoders

- Greedy layer-wise training
- Start with training first layer
 - Learn to encode x to h_1 and to decode x from h_1
 - Use backpropagation
- Map from all x 's to h_1 's
 - Discard decoder for now
- Train the second layer
 - Learn to encode h_1 to h_2 and to decode h_2 from h_1
 - Repeat for as many layers

Stacked autoencoders

- Greedy layer-wise training
- Start with training first layer
 - Learn to encode x to h_1 and to decode x from h_1
 - Use backpropagation
- Map from all x 's to h_1 's
 - Discard decoder for now
- Train the second layer
 - Learn to encode h_1 to h_2 and to decode h_2 from h_1
 - Repeat for as many layers
- Reconstruct using previously learned decoders mappings
- Fine-tune the full network end-to-end

Stacked denoising autoencoders

- Can extend this to a denoising model
- Add noise when training each of the layers
 - Often with increasing amount of noise per layer
 - 0.1 for first, 0.2 for second, 0.3 for third

Deep representations

- What can we do with them?
- Compression
 - Can work better than PCA
 - [Hinton and Salakhutdinov, Reducing the dimensionality of data with neural networks, 2006]

Deep representations

- What can we do with them?
- Compression
 - Can work better than PCA
 - [Hinton and Salakhutdinov, Reducing the dimensionality of data with neural networks, 2006]
- Discarding the decoder and using the middle layer as a representation
- Finetuning the autoencoder for a task

Multimodal representations

Multimodal representations

- What do we want from multi-modal representation
 - Similarity in that space implies similarity in corresponding *concepts*
 - Useful for various discriminative tasks – retrieval, mapping, fusion etc.
 - Possible to obtain in absence of one or more modalities
 - Fill in missing modalities given others (map between modalities)

Core Challenge: Multimodal Representation

Definition: Learning how to represent and summarize multimodal data in a way that exploits the complementarity and redundancy.

Ⓐ Joint representations:

Joint Multimodal Representation

Core Challenge 1: Representation

Definition: Learning how to represent and summarize multimodal data in a way that exploits the complementarity and redundancy.

Ⓐ Joint representations:

Ⓑ Coordinated representations:

Unsupervised Joint representations

Shallow multimodal representations

- Want deep multimodal representations
 - Shallow representations do not capture complex relationships
 - Often shared layer only maps to the shared section directly

Shallow RBM

Shallow Autoencoder

Deep Multimodal autoencoders

- A deep representation learning approach
- A bimodal auto-encoder
 - Used for Audio-visual speech recognition

- [Ngiam et al., Multimodal Deep Learning, 2011]

Deep Multimodal autoencoders - training

- Individual modalities can be pre-trained
 - Denoising Autoencoders
- To train the model to reconstruct the other modality
 - Use both
 - Remove audio

Deep Multimodal autoencoders - training

- Individual modalities can be pretrained
 - RBMs
 - Denoising Autoencoders
- To train the model to reconstruct the other modality
 - Use both
 - Remove audio
 - Remove video

Deep Multimodal autoencoders

- Can now discard the decoder and use it for the AVSR task
- Interesting experiment
 - “Hearing to see”

Deep Multimodal Boltzmann machines

- Generative model
- Individual modalities trained like a DBN
- Multimodal representation trained using Variational approaches
- Used for image tagging and cross-media retrieval
- Reconstruction of one modality from another is a bit more “natural” than in autoencoder representation
- Can actually sample text and images

- [Srivastava and Salakhutdinov, Multimodal Learning with Deep Boltzmann Machines, 2012, 2014]

Deep Multimodal Boltzmann machines

- Pre-training on unlabeled data helps
- Can use generative models

Model	MAP	Prec@50
Random	0.124	0.124
SVM (Huiskes et al., 2010)	0.475	0.758
LDA (Huiskes et al., 2010)	0.492	0.754
DBM	0.526 ± 0.007	0.791 ± 0.008
DBM (using unlabelled data)	0.585 ± 0.004	0.836 ± 0.004

Deep Multimodal Boltzmann Machines

- Text information can help visual predictions!
 - Image retrieval task on MIR Flickr dataset

Model	MAP	Prec@50
Image LDA (Huiskes et al., 2010)	0.315	-
Image SVM (Huiskes et al., 2010)	0.375	-
Image DBN	0.463 $\pm$ 0.004	0.801 $\pm$ 0.005
Image DBM	0.469 $\pm$ 0.005	0.803 $\pm$ 0.005
Multimodal DBM (generated text)	0.531 $\pm$ 0.005	0.832 $\pm$ 0.004

Analyzing Intermediate Representations

Comparing deep multimodal representations

- Difference between them and the RBMs and the autoencoders
- Overall very similar behavior

Model	DBN	DAE	DBM
Logistic regression on joint layer features	0.599 ± 0.004	0.600 ± 0.004	0.609 ± 0.004
Sparsity + Logistic regression on joint layer features	0.626 ± 0.003	0.628 ± 0.004	0.631 ± 0.004
Sparsity + discriminative fine-tuning	0.630 ± 0.004	0.630 ± 0.003	0.634 ± 0.004
Sparsity + discriminative fine-tuning + dropout	0.638 ± 0.004	0.638 ± 0.004	0.641 ± 0.004

Supervised Joint representations

Multimodal Joint Representation

- For supervised learning tasks
- Joining the unimodal representations:
 - Simple concatenation
 - Element-wise multiplication or summation
 - Multilayer perceptron
- How to explicitly model both unimodal and bimodal interactions?

Multimodal Sentiment Analysis

MOSI dataset (Zadeh et al, 2016)

- 2199 subjective video segments
- Sentiment intensity annotations
- 3 modalities: text, video, audio

Multimodal joint representation:

$$h_m = f(W \cdot [h_x, h_y, h_z])$$

Unimodal, Bimodal and Trimodal Interactions

Bilinear Pooling

Models bimodal interactions:

$$h_m = h_x \otimes h_y = h_x \otimes h_y$$

[Tenenbaum and Freeman, 2000]

Multimodal Tensor Fusion Network (TFN)

Models both unimodal and bimodal interactions:

$$h_m = \begin{bmatrix} h_x \\ 1 \end{bmatrix} \otimes \begin{bmatrix} h_y \\ 1 \end{bmatrix} = \begin{bmatrix} h_x & h_x \otimes h_y \\ 1 & h_y \end{bmatrix}$$

Important!

[Zadeh, Jones and Morency, EMNLP 2017]

Multimodal Tensor Fusion Network (TFN)

Can be extended to three modalities:

$$h_m = \begin{bmatrix} h_x \\ 1 \end{bmatrix} \otimes \begin{bmatrix} h_y \\ 1 \end{bmatrix} \otimes \begin{bmatrix} h_z \\ 1 \end{bmatrix}$$

Explicitly models **unimodal**,
bimodal and **trimodal**
interactions !

[Zadeh, Jones and Morency, EMNLP 2017]

Experimental Results – MOSI Dataset

Multimodal Baseline	Binary		5-class	Regression	
	Acc(%)	F1	Acc(%)	MAE	r
Random	50.2	48.7	23.9	1.88	-

TFN _{early}	75.2	76.2	39.0	0.96	0.63

From Tensor Representation to Low-rank Fusion

① Decomposition of weight tensor W

② Decomposition of Z

③ Rearranging computation

Multimodal Encoder-Decoder

- Visual modality often encoded using CNN
- Language modality will be decoded using LSTM
 - A simple multilayer perceptron will be used to translate from visual (CNN) to language (LSTM)

Coordinated Multimodal Representations

Coordinated multimodal embeddings

- Instead of projecting to a joint space enforce the similarity between unimodal embeddings

Coordinated Multimodal Representations

Learn (unsupervised) two or more coordinated representations from multiple modalities. A loss function is defined to bring closer these multiple representations.

Coordinated Multimodal Embeddings

What should be the loss function?

[Frome et al., DeViSE: A Deep Visual-Semantic Embedding Model, NIPS 2013]

Max-Margin Loss – Multimodal Embeddings

Max-margin:

$$d(x_i, y_j) + m < d(x_i, y_k) \quad \forall y_j \in Y_i^+, \forall y_k \in Y_i^-$$

Margin

Positive labels

Negative labels

[Frome et al., DeViSE: A Deep Visual-Semantic Embedding Model, NIPS 2013]

Structure-preserving Loss – Multimodal Embeddings

Symmetric max-margin:

$$d(x_i, y_j) + m < d(x_i, y_k) \quad \forall y_j \in Y_i^+, \forall y_k \in Y_i^-$$

$$d(x_{j'}, y_{i'}) + m < d(x_{k'}, y_{i'}) \quad \forall x_{j'} \in X_{i'}^+, \forall x_{k'} \in X_{i'}^-$$

Neighborhood of x_i :
images that share the
same meaning (text)

Structure-preserving constraints

$$d(x_i, x_j) + m < d(x_i, x_k) \quad \forall x_j \in N(x_i), \forall x_k \notin N(x_i)$$

$$d(y_{i'}, y_{j'}) + m < d(y_{i'}, y_{k'}) \quad \forall y_{j'} \in N(y_{i'}), \forall y_{k'} \notin N(y_{i'})$$

[Wang et al., Learning Deep Structure-Preserving Image-Text Embeddings, CVPR 2016]
