- Remote Databases (Firebase)

Week #

Outline

- Logistics
- Code Review Example
- Remote Databases (Firebase)

Code review

- Are there logic errors or edge cases that weren't considered?
- Is the code written idiomatically so that it follows best practices for the language and can be maintained in the future?
- Are there alternative (potentially cleaner) approaches to implementing the same functionality?

• Company/team socialization!

Code review- what to look for?

- Architecture review
- Tests
- Logic/functionality errors
- Complexity
- Comments
- Style

Try it out: sample pull request

Outline

- Logistics
- Code Review Example
- Remote Databases (Firebase)

Remote Cloud Databases

- Where does the data for your app come from?
 - Local SQLite database
 - Web API
 - Your own backend service
- Remote cloud database: combines benefits of local storage using SQLite and Web APIs

Build your own backend

- Use a technology such as Django (Python), Ruby on Rails, Node (Javascript), etc. to create your own backend, hosted on a server
- Lots of headaches, and requires expertise in various domains:
 - Redundancy/robustness: database backups
 - Scaling: what happens when your app becomes popular?
 - Security: database passwords, key rotation, etc.

BaaS = Backend as a service

- Platforms for database/service hosting, management, deployment, etc.
- Free for most student/toy projects, you only get charged for usage beyond the free tier.
- Features:
 - Easy setup and integration with mobile apps
 - Web UI to view/modify data
 - APIs to perform CRUD operations on the data
 - As a developer, you must comply with the limitations around querying

NoSQL databases

- NoSQL databases: does not use SQL to access the data, there is no strict schema
 - **Benefits**: simplicity, flexibility, "horizontal" scalability to many servers
 - **Drawbacks**: some queries are more expensive, less structure around data may lead to data inconsistency, lack of "ACID"

<u>Firebase</u>

- Remote database management platform, owned by Google
 - Has become more popular since Facebook stopped managing Parse
 - Incorporates many services to develop your app, grow your user base, and monetize.
 - Popular among hobbyists and for early-stage startups

Build your app

Improve app quality

App Distribution

Performance Monitoring

Grow your business

Firestore

- "Flexible, scalable database for mobile, web, and server development"
- Keeps data in sync across clients through real time updates
- Automatic offline support

Firestore

- NoSQL cloud database to store and sync data
- Made up of documents and collections
 - Documents are like JSON objects which have fields of various types
 - Collections are a group of documents

• Documents define the attributes for that object

I want posts by all users in the InstaFire app

Here's a list of posts:1. Post "vacation pic!"2. Post "Golden Gate"3.

Cloud Firestore
