Problems 000

Handling empty tuples

SQL can test whether a subquery has at all any tuple in its result or not. The exists construct returns the value true if the argument subquery is nonempty.

```
select ...
from ...
where exists (
select ...
from ...
where ...);
```

Note: We can test for the nonexistence of tuples in a subquery by using the not exists construct.

Problems 000

Handling empty tuples – Practical applications

Consider another table as follows.

Table: BANK2

ID	CUSTOMER	ACCOUNT	YEAR
11110001	John Trevor	Current	2018
11110002	Anurak Eshin	Savings	2019
11110003	Somlata Sen	Current	2019
11110004	Ezhil Swami	Current	2019
11110005	Panna Singh	Savings	2019
11110006	Aarohi Tendulkar	Savings	2020
11110007	Aravind Babu	Current	2020
11110008	Jahanara Begum	Savings	2020
11110009	Aarohi Tendulkar	Current	2021

Handling empty tuples – Practical applications

Suppose the customer details of two banks are provided in the form of two separate tables (as shown in BANK1 and BANK2). The names of all the customers, who have accounts in both the banks, can be retrieved with the following SQL query.

select BANK1.CUSTOMER from BANK1, BANK2 where BANK1.CUSTOMER = BANK2.CUSTOMER;

This will yield the following result.

CUSTOMER				
Aarohi Tendulkar				
Jahanara Begum

Handling empty tuples – Practical applications

Suppose the customer details of two banks are provided in the form of two separate tables (as shown in BANK1 and BANK2). The names of all the customers, who have accounts in both the banks, can be retrieved with the following SQL query.

select BANK1.CUSTOMER from BANK1, BANK2 where BANK1.CUSTOMER = BANK2.CUSTOMER;

This will yield the following result.

CUSTOMER Aarohi Tendulkar Jahanara Begum

<u>Note</u>: The space requirement of this approach is huge (as Cartesian product is to be performed).

0	0000000	00000	000

Handling empty tuples - Practical applications

This can be efficiently done with the following alternative query.

```
select CUSTOMER
from BANK1
where exists (
select CUSTOMER
from BANK2
where BANK1.CUSTOMER = BANK2.CUSTOMER);
```

Note: Existence of tuples in the relation returned by the subquery is verified tuplewise from the main query (not as a whole).

Problems

Handling duplicate tuples (in Oracle)

SQL can test whether a subquery has any duplicate tuples in its result or not. The unique construct returns the value true if the argument subquery contains no duplicate tuples.

```
select ...
from ...
where unique (
select ...
from ...
where ...);
```

Note: We can test for the existence of duplicate tuples in a subquery by using the not unique construct.

Dealing with Nullity and Duplicity

Problems

Handling duplicate tuples – Practical applications (in Oracle)

Suppose the customer details of two banks are provided in the form of two separate tables (as shown in BANK1 and BANK2). The names of all the customers, who have any arbitrary number of accounts in BANK1 but exactly one account in BANK2, can be retrieved with the following SQL query.

```
select CUSTOMER
from BANK1
where unique (
select CUSTOMER
from BANK2
where BANK1.CUSTOMER = BANK2.CUSTOMER);
```

We can define a view in SQL by using the create view construct. View names may appear in any place that a relation name may appear. To define a view, we must give the view a name and must state the query that computes the view.

The form of the create view command is as follows:

create view <view_name> as <query_expression>;

where query_expression is any arbitrary query expression which is legal.

0	0000000	0000	000
_			

Creating views

```
create view BANK2_VIEW as
select * from BANK2 where YEAR = 2020;
select * from BANK2_VIEW;
```

This will yield the following result.

ID	CUSTOMER	ACCOUNT	YEAR
11110006	Aarohi Tendulkar	Savings	2020
11110007	Aravind Babu	Current	2020
11110008	Jahanara Begum	Savings	2020

~				

Creating views

```
create view BANK2_VIEW as
select * from BANK2 where YEAR = 2020;
select * from BANK2_VIEW;
```

This will yield the following result.

ID	CUSTOMER	ACCOUNT	YEAR
11110006	Aarohi Tendulkar	Savings	2020
11110007	Aravind Babu	Current	2020
11110008	Jahanara Begum	Savings	2020

<u>Note</u>: A view is a logical representation of another table (termed as base table). Any change in the view is also reflected (if permissible) on the base table. However, this change is temporary.

Updating view	VS		

SQL allows a view name to appear wherever a relation may appear. Hence, we can use the following constructs.

select * from <view_name> where ...;

or

insert into <view_name> values (...);

etc.

Outline 0	Dealing with Nullity and Duplicity	View 0000●	Problems
Dropping view	VS		

We can drop a view in SQL by using the drop view construct as follows.

drop view <view_name>;

Note: The view definition stays in the database until it is dropped.

- Consider the following schema of an online code repository system like GitHub:
 - CONTRIBUTOR =
 - $\langle \underline{contributor_id} : integer, contributor_name : string \rangle$
 - CODE-GROUP = (contributor_id : integer, code_group : string, count_submissions : integer)

Write the following queries in SQL.

- Find all the contributors who have made no submissions within the Java code group.
- Find all the contributors who have made at most one submission within the R code group.
- Find all the contributors who have made at least three submissions within the Scala code group.

3 Consider the following schema of a bank:

- BRANCH = (<u>branch_id</u> : integer, branch_name : string, branch_city : string, assets : real)
- CUSTOMER = (customer_id : integer, customer_name : string, customer_street : string, customer_city : string)
- ACCOUNT = (<u>account_number</u> : integer, customer_id : integer, branch_name : string, balance : real)
- DEPOSITOR = (<u>customer_id</u> : integer, customer_name : string, account_number : integer)
- BORROWER =

(customer_name : string, loan_number : integer)

Write the following queries in SQL.

- Find all customers who have both an account and a loan at the bank.
- Find all customers who have an account at all the branches located in Kolkata.

- 4 Consider the following schema.
 - EMPLOYEE = (empid_id : integer, fullname : string, managerid : integer, dataofjoining : date)
 - EMPSALARY =

 $\langle {\sf empid}_{\sf id}: {\sf integer}, {\sf project}: {\sf string}, {\sf salary}: {\sf integer}
angle$

Write the following queries in SQL.

- Fetch employee names having salary no lesser than 5000 and no higher than 10000.
- Fetch only the first name (string before space) from the fullname column of EMPLOYEE table.
- Fetch all employees from the EMPLOYEE table who are also managers.
- Fetch only odd rows from the table *EMPSALARY*.
- Find the third highest salary from the table EMPSALARY.
