# Multimodal Machine Learning

## Lecture 11.2: Transference 2 – Co-learning and Co-training

Paul Liang

*\* Co-lecturer: Louis-Philippe Morency.  
Original course co-developed with Tadas Baltrusaitis.  
Spring 2021 edition taught by Yonatan Bisk*

# Reading Assignments are Back!

---

- Four main steps for the reading assignments
  - Monday 8pm: Official start of the assignment
  - Wednesday 8pm: Select your paper
  - **Friday 8pm:** Post your summary
  - **Monday 8pm:** Post your extra comments (5 posts)
- **4 papers:** multimodal multi-hop reasoning, multimodal geometric reasoning, multimodal robotics, multimodal knowledge bases.

# Final Project Report (Due Sunday 12/11 at 8pm)

---

## Main goals:

1. Produce a research paper which will motivate your research problem, describe the prior work, present your research contributions, explain the details of your experiments, and discuss your results.
2. Novel research ideas (N-1 new ideas for N students)
  - Novel algorithm
  - Novel application
3. Incorporate feedback from previous milestones
4. Compare to multimodal baselines from midterm report
  1. Did the proposed ideas solve the errors highlighted in error analysis?
  2. Broader implications of proposed ideas.

# Final Project Presentations (Tuesday 12/6 and Thursday 12/8)

---

## Main objective:

- Present your research ideas and get feedback from classmates
- Focus on only one of your new research ideas
- All students should present and answer questions
- Be sure to be on time! We have many presentations each day 😊
- All presentations are in person (no remote presentations)

## Presentation length:

- 30-seconds elevator pitch
  - 4-minute full presentation – all students should present
- 
- Following each presentation, audience will be asked to share feedback

# Transference

---

**Definition:** Transfer knowledge between modalities, usually to help the primary modality which may be noisy or with limited resources

**Sub-challenges:**

**Transfer**

**Co-learning**

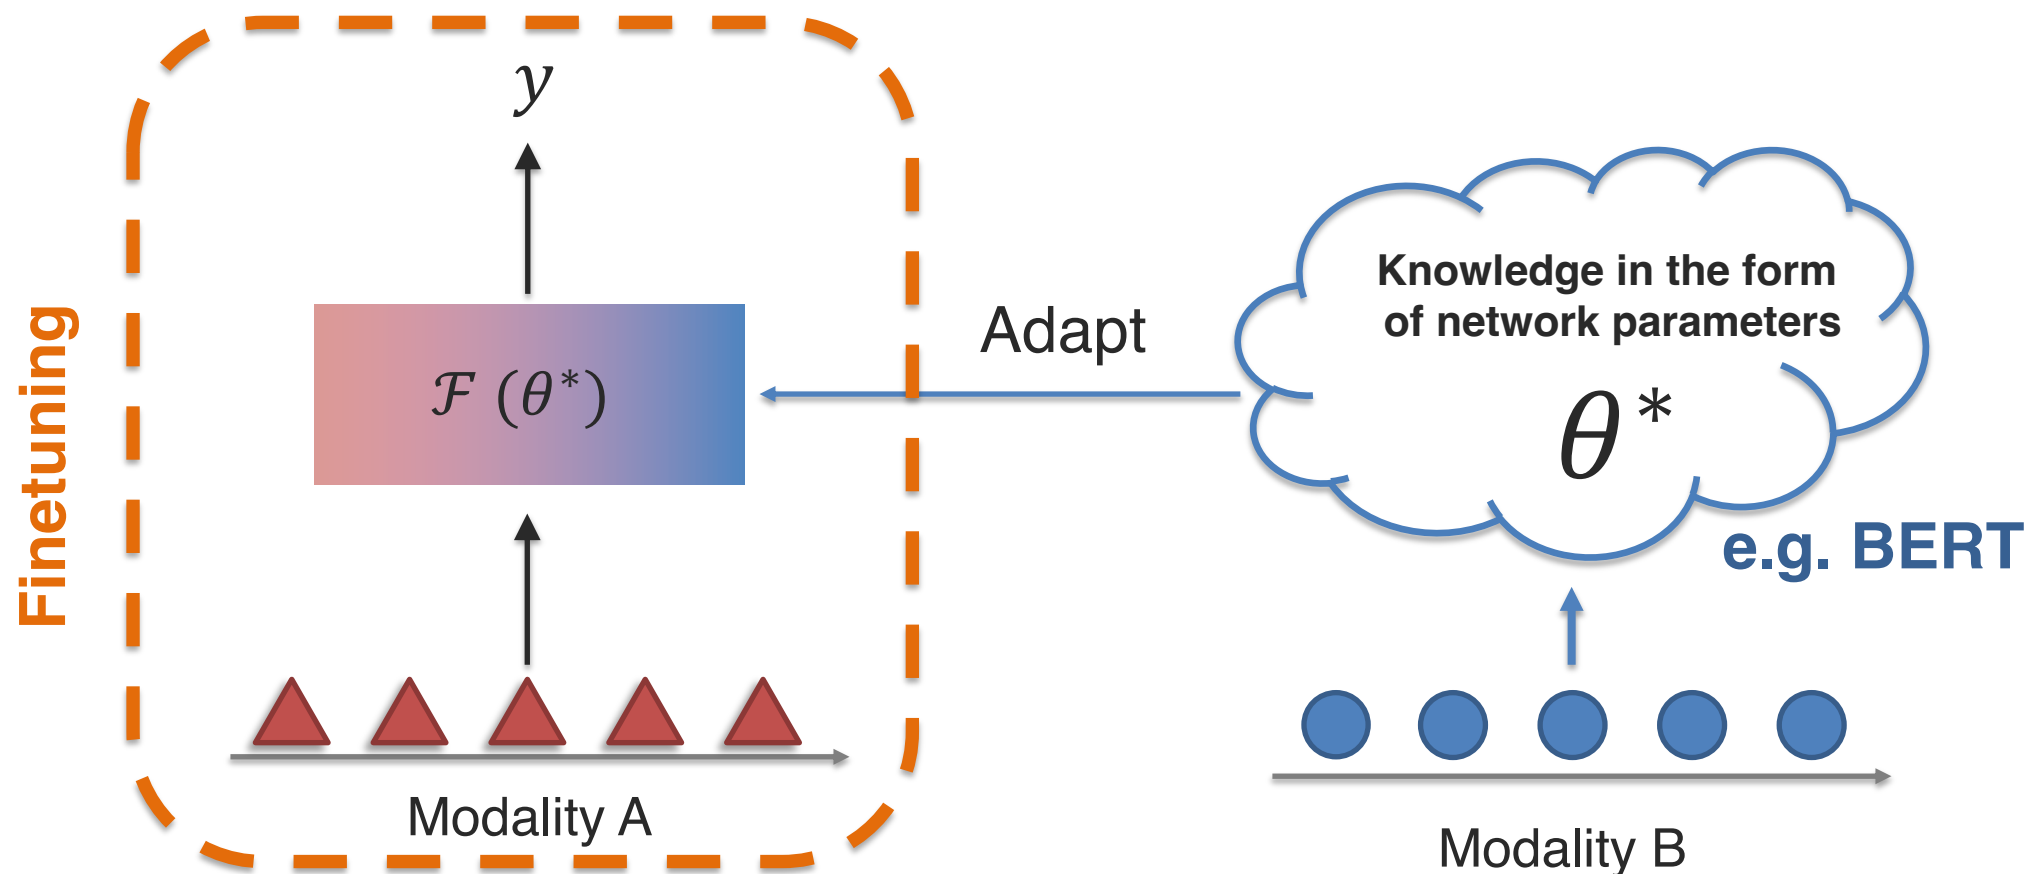

**Model Induction**

## Sub-Challenge 5a: Transfer via Pretrained Models

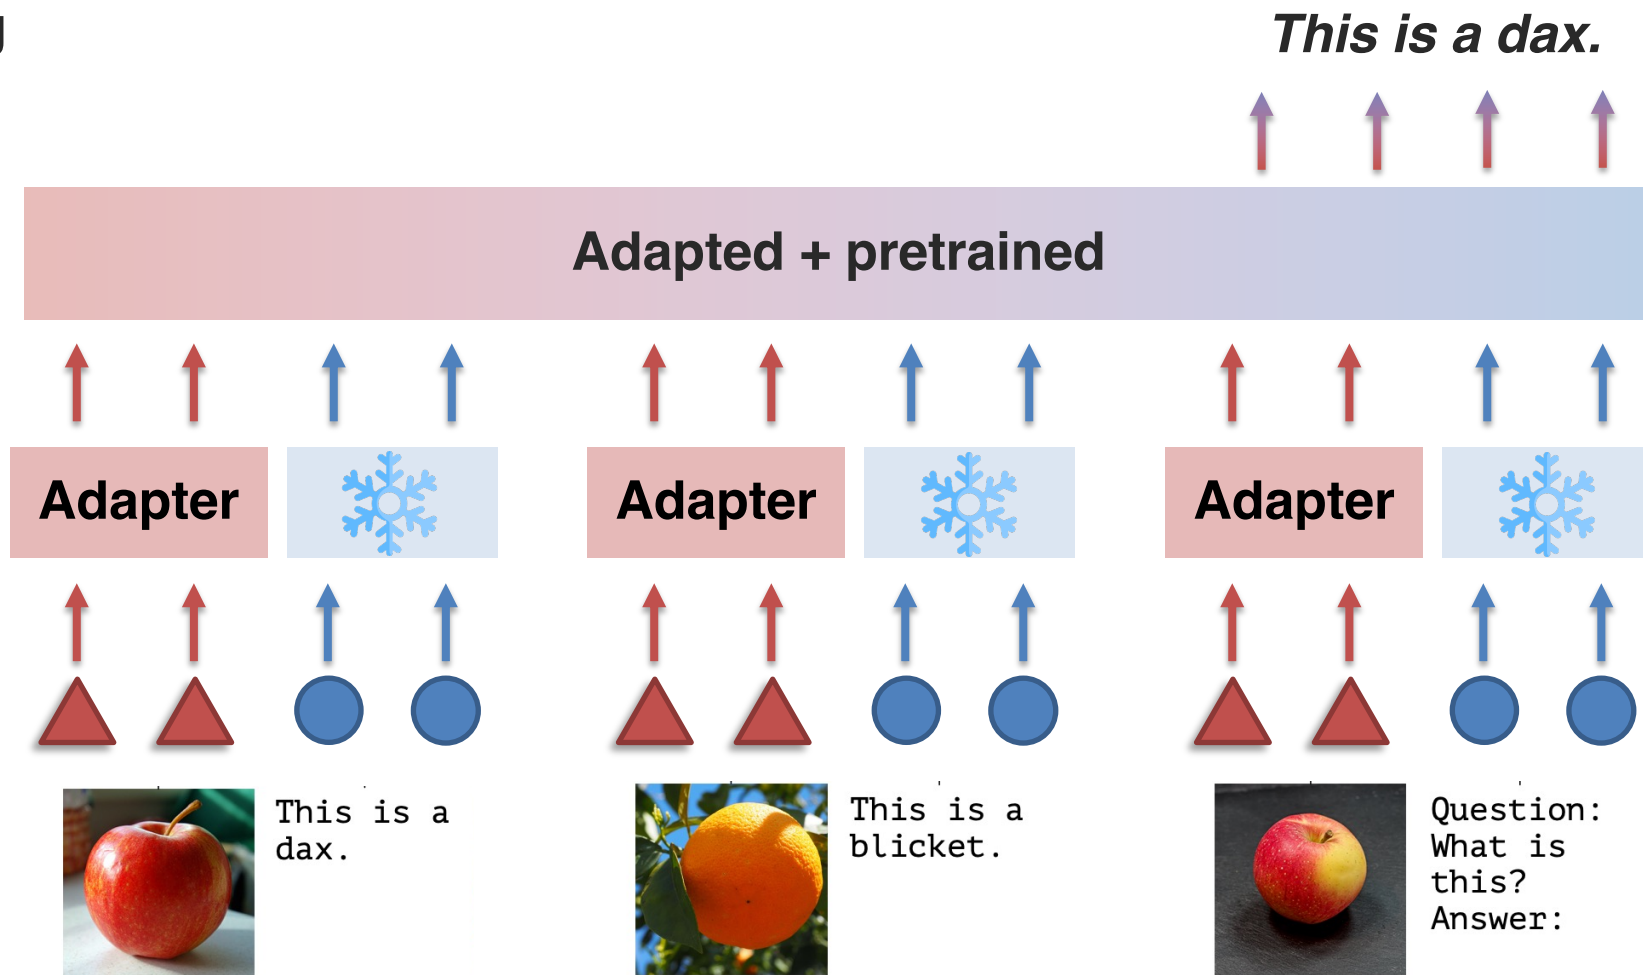

**Definition:** Transferring knowledge from large-scale pretrained models to downstream tasks involving the primary modality.

# Sub-Challenge 5a: Transfer via Pretrained Models

## Transfer via prefix tuning

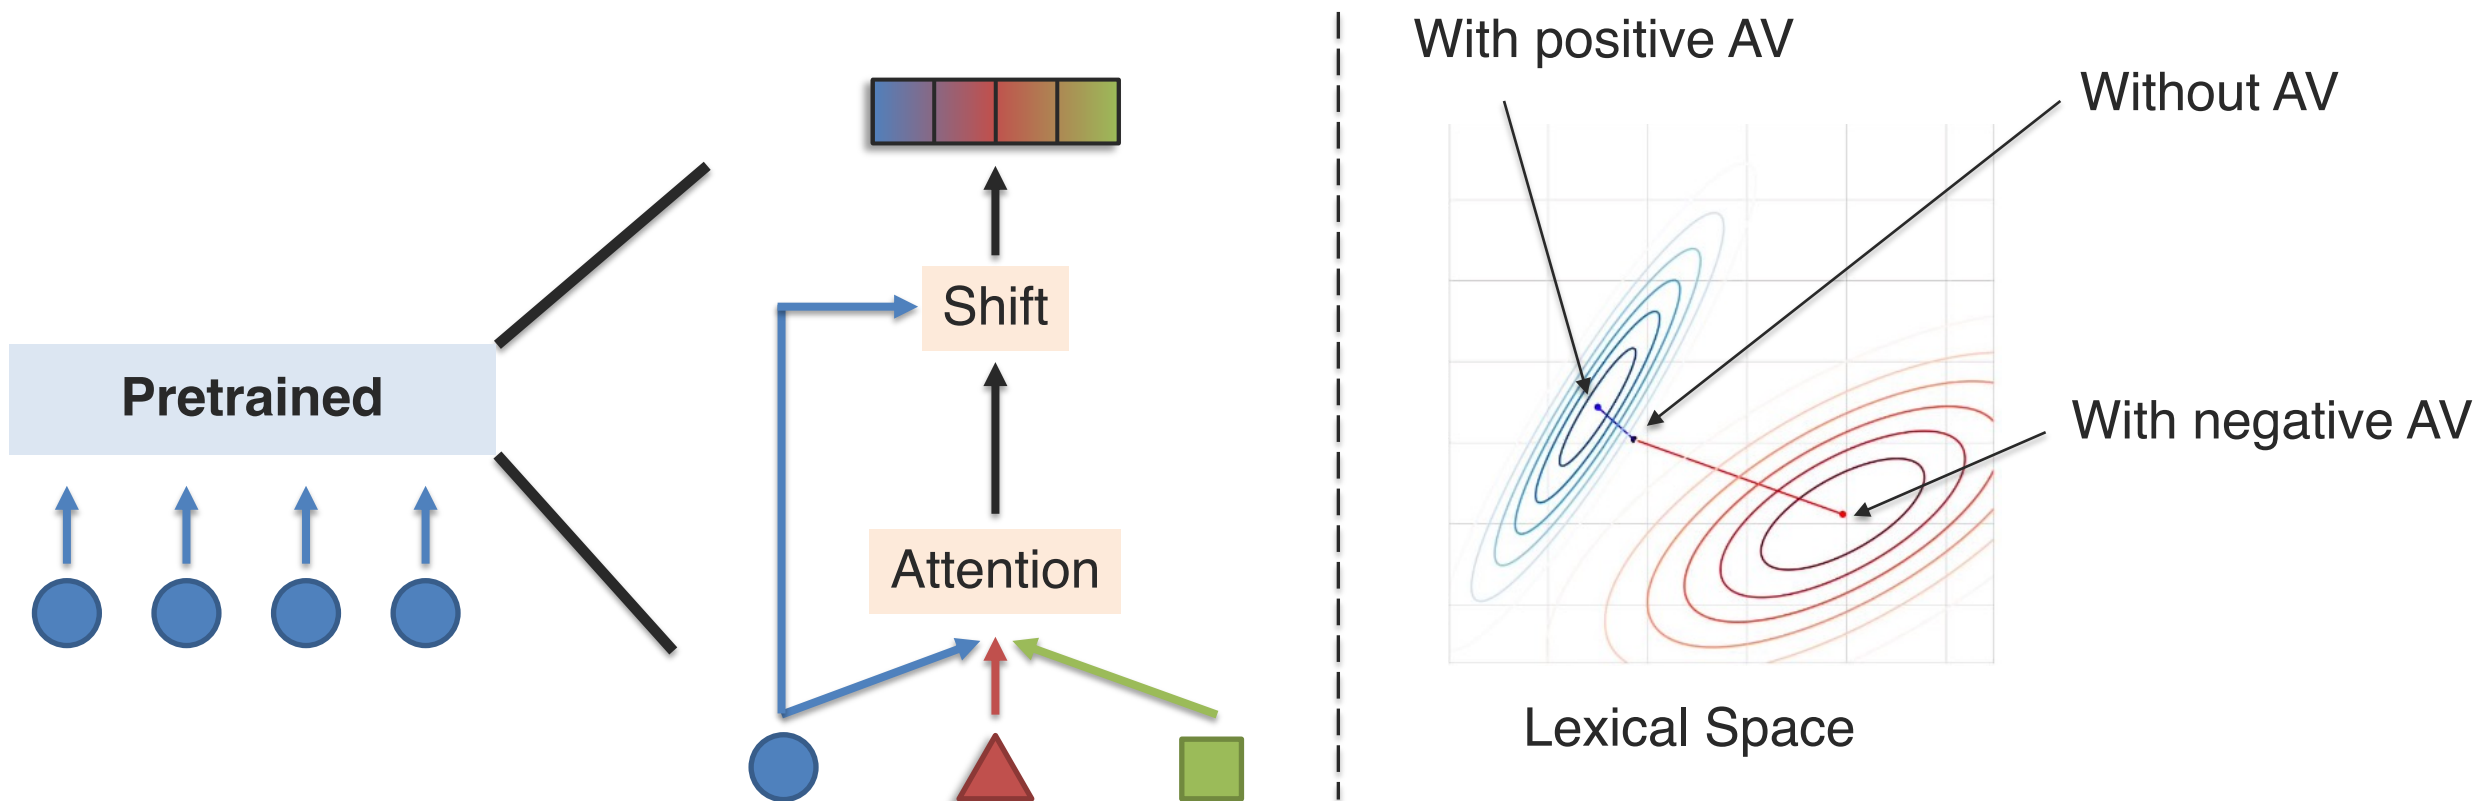

Few-shot image classification:

[Tsimpoukelli et al., Multimodal Few-Shot Learning with Frozen Language Models. NeurIPS 2021]

# Sub-Challenge 5a: Transfer via Pretrained Models

## Transfer via representation tuning

[Ziegler et al., Encoder-Agnostic Adaptation for Conditional Language Generation. arXiv 2019]

[Rahman et al., Integrating Multimodal Information in Large Pretrained Transformers. ACL 2020]

## Sub-Challenge 5a: Transfer via Pretrained Models

---

1. Disentanglement

$$\mathcal{L}_\beta(\mathbf{x}) = \mathbb{E}_{q_\phi(\mathbf{z}|\mathbf{x})}[\log p_\theta(\mathbf{x}|\mathbf{z})] - \beta \cdot \text{KL}(q_\phi(\mathbf{z}|\mathbf{x})||p(\mathbf{z}))$$

2. Conditioning

$$p(\mathbf{x}_{0:T} | y) = p(\mathbf{x}_T) \prod_{t=1}^T p_\theta(\mathbf{x}_{t-1} | \mathbf{x}_t, y)$$

3. Prompt tuning

4. Representation tuning

5. Classifier gradient tuning

$$\nabla \log p(\mathbf{x}_t | y) = \underbrace{\nabla \log p(\mathbf{x}_t)}_{\text{unconditional score}} + \gamma \underbrace{\nabla \log p(y | \mathbf{x}_t)}_{\text{classifier gradient}}$$

6. Classifier-free tuning

$$\nabla \log p(\mathbf{x}_t | y) = \underbrace{\gamma \nabla \log p(\mathbf{x}_t | y)}_{\text{conditional score}} + \underbrace{(1 - \gamma) \nabla \log p(\mathbf{x}_t)}_{\text{unconditional score}}$$

# Multitask and Transfer Learning

How can we transfer knowledge across multiple tasks, each over a different subset of modalities?

Video classification

Language Video Audio

This diagram illustrates the Video classification task. It features three modalities: Language (represented by a blue circle and a word cloud), Video (represented by a red triangle and a photo of a dog), and Audio (represented by a green square and a spectrogram). The labels 'Language', 'Video', and 'Audio' are positioned below their respective icons.

Sentiment, emotions

Audio Video

This diagram illustrates the Sentiment, emotions task. It features two modalities: Audio (represented by a green square and a spectrogram) and Video (represented by a red triangle and a photo of a person). The labels 'Audio' and 'Video' are positioned below their respective icons.

Robot dynamics

Video Time-series

This diagram illustrates the Robot dynamics task. It features two modalities: Video (represented by a red triangle and a street scene with green bounding boxes) and Time-series (represented by an orange pentagon and a line graph). The labels 'Video' and 'Time-series' are positioned below their respective icons.

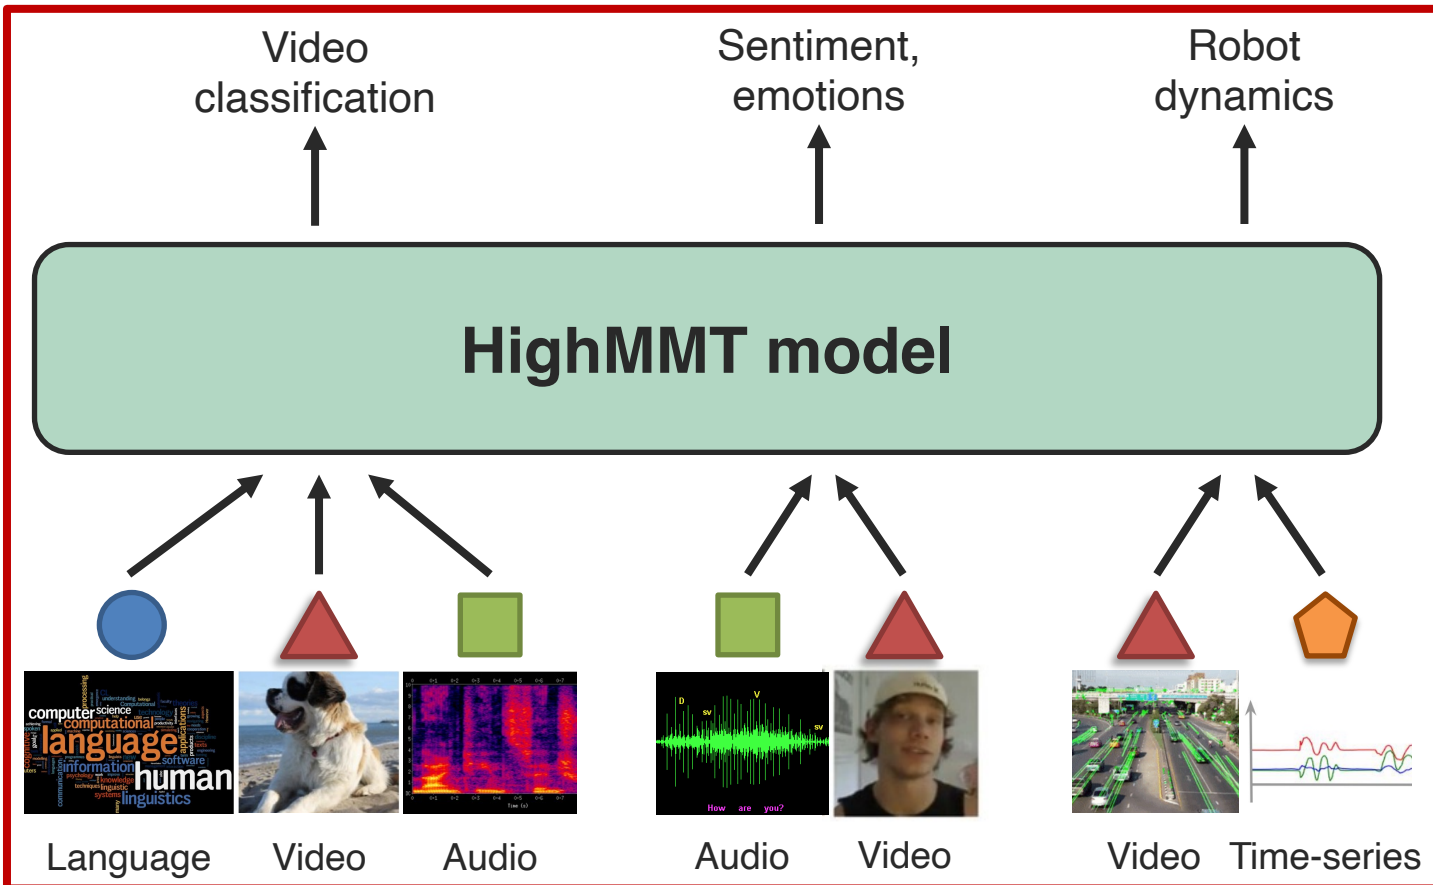

Generalization across modalities and tasks  
Important if some tasks are low-resource

[Liang et al., HighMMT: Towards Modality and Task Generalization for High-Modality Representation Learning. arXiv 2022]

# Multitask and Transfer Learning

## Transfer across partially observable modalities

HighMMT: unified model + parameter sharing + multitask and transfer learning

Non-parallel multitask learning

Task-specific classifiers

**Same model architecture!**

Shared multimodal model

**Same parameters!**

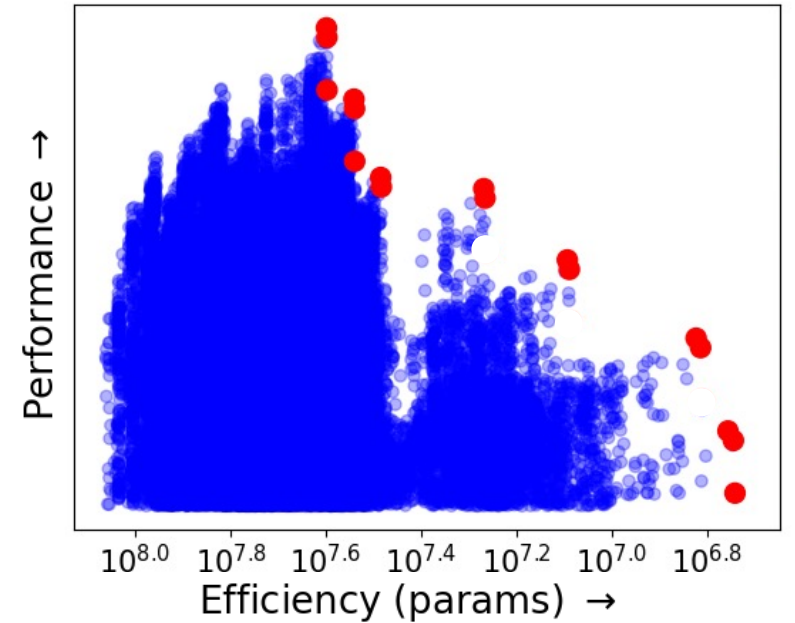

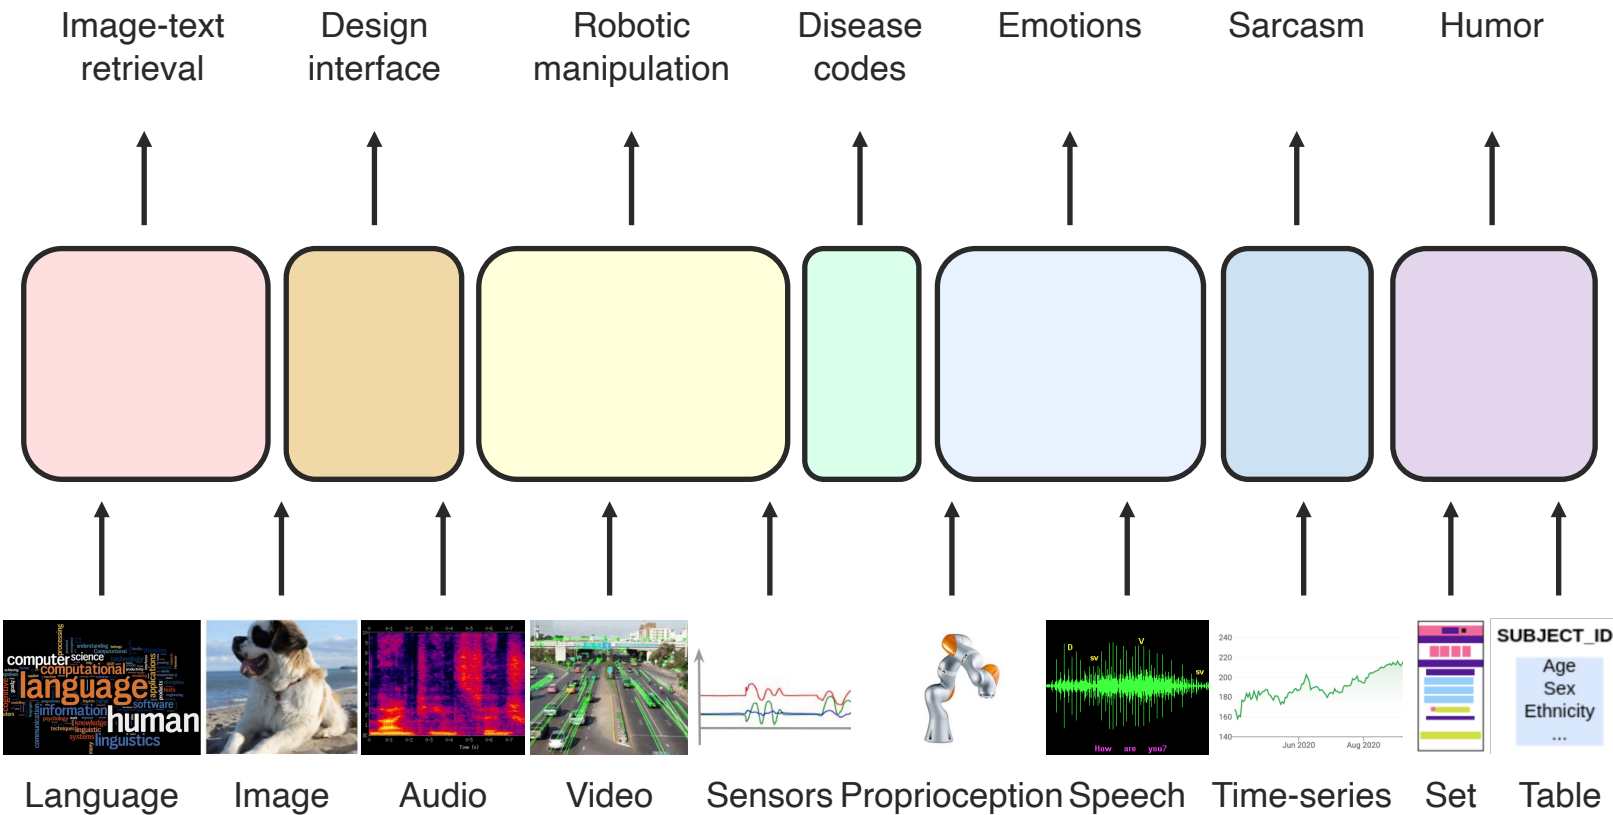

Modality-specific embeddings

Standardized input sequence

[Liang et al., HighMMT: Towards Modality and Task Generalization for High-Modality Representation Learning. arXiv 2022]

# Multitask and Transfer Learning

Traditional approaches: different model + different parameters

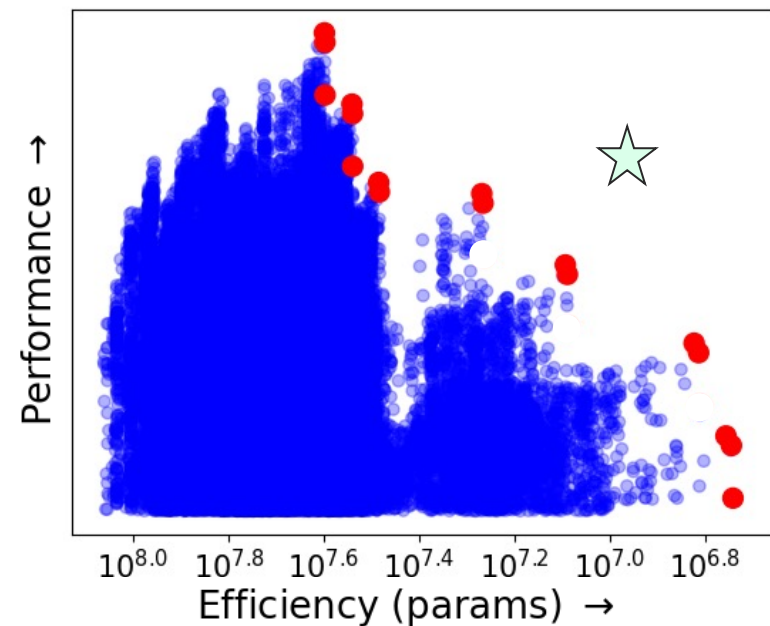

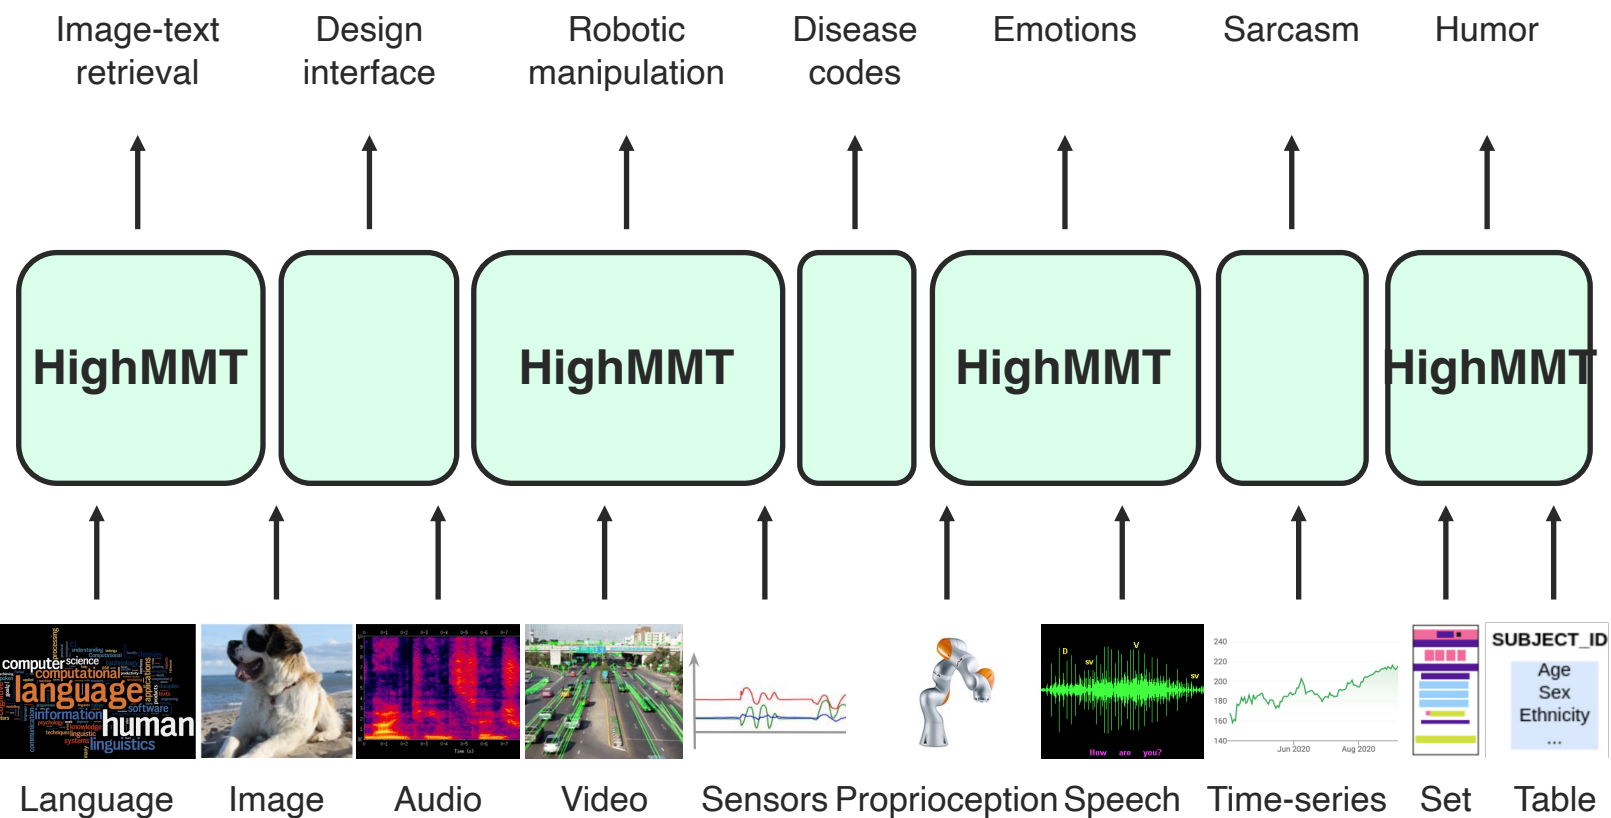

- All model combinations (>10,000)
- Pareto front

[Liang et al., HighMMT: Towards Modality and Task Generalization for High-Modality Representation Learning. arXiv 2022]

# Multitask and Transfer Learning

Traditional approaches: different model + different parameters

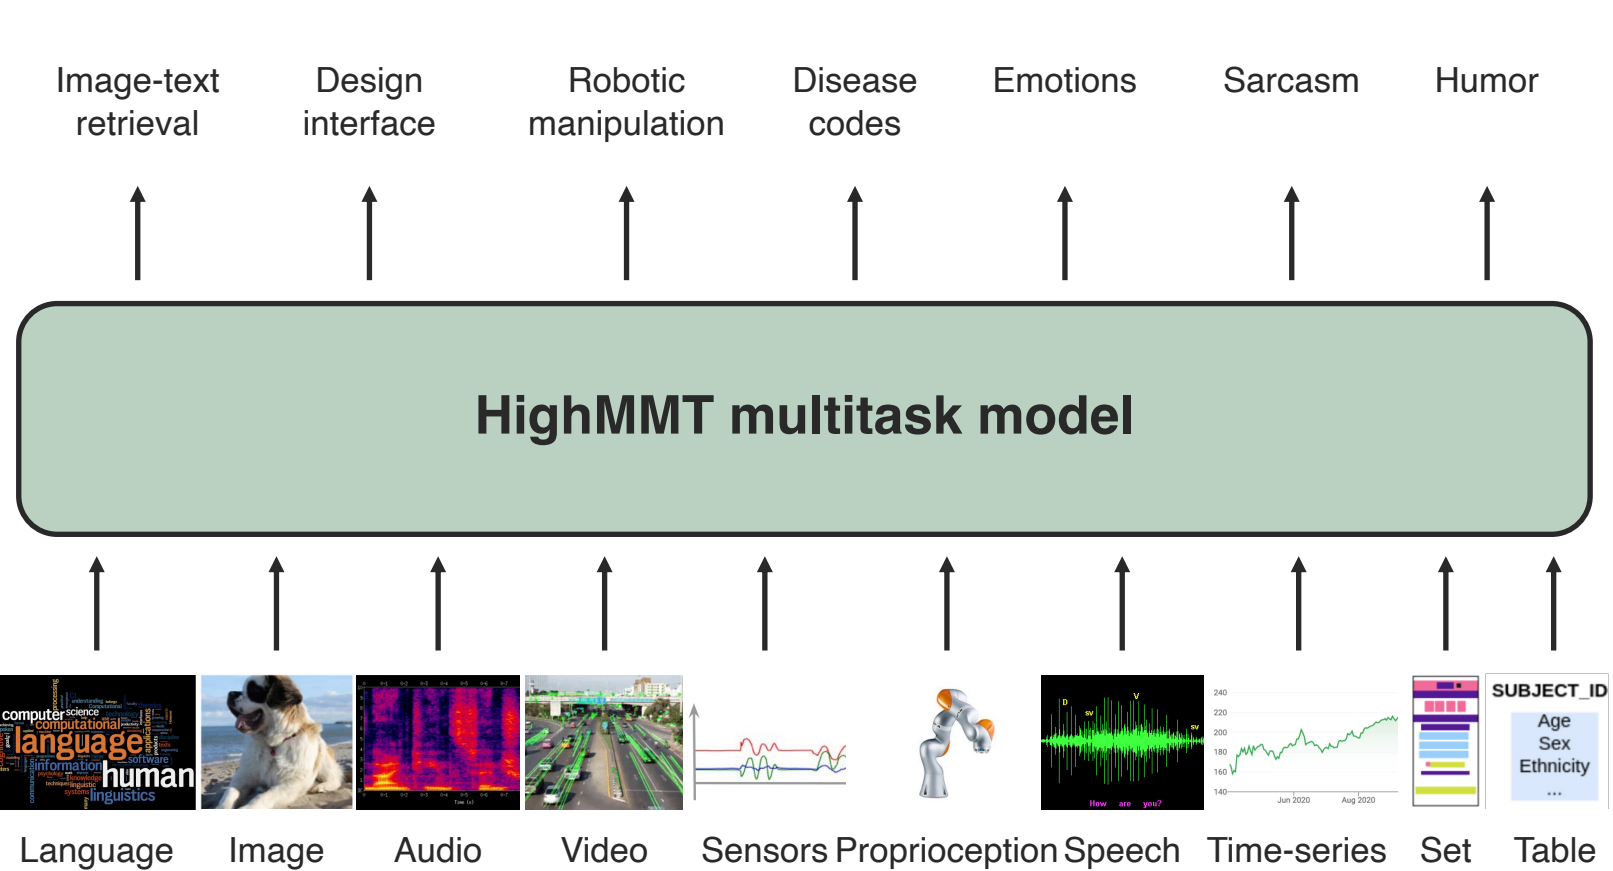

- All model combinations (>10,000)
- Pareto front
- HighMMT single-task

[Liang et al., HighMMT: Towards Modality and Task Generalization for High-Modality Representation Learning. arXiv 2022]

# Multitask and Transfer Learning

Traditional approaches: different model + different parameters

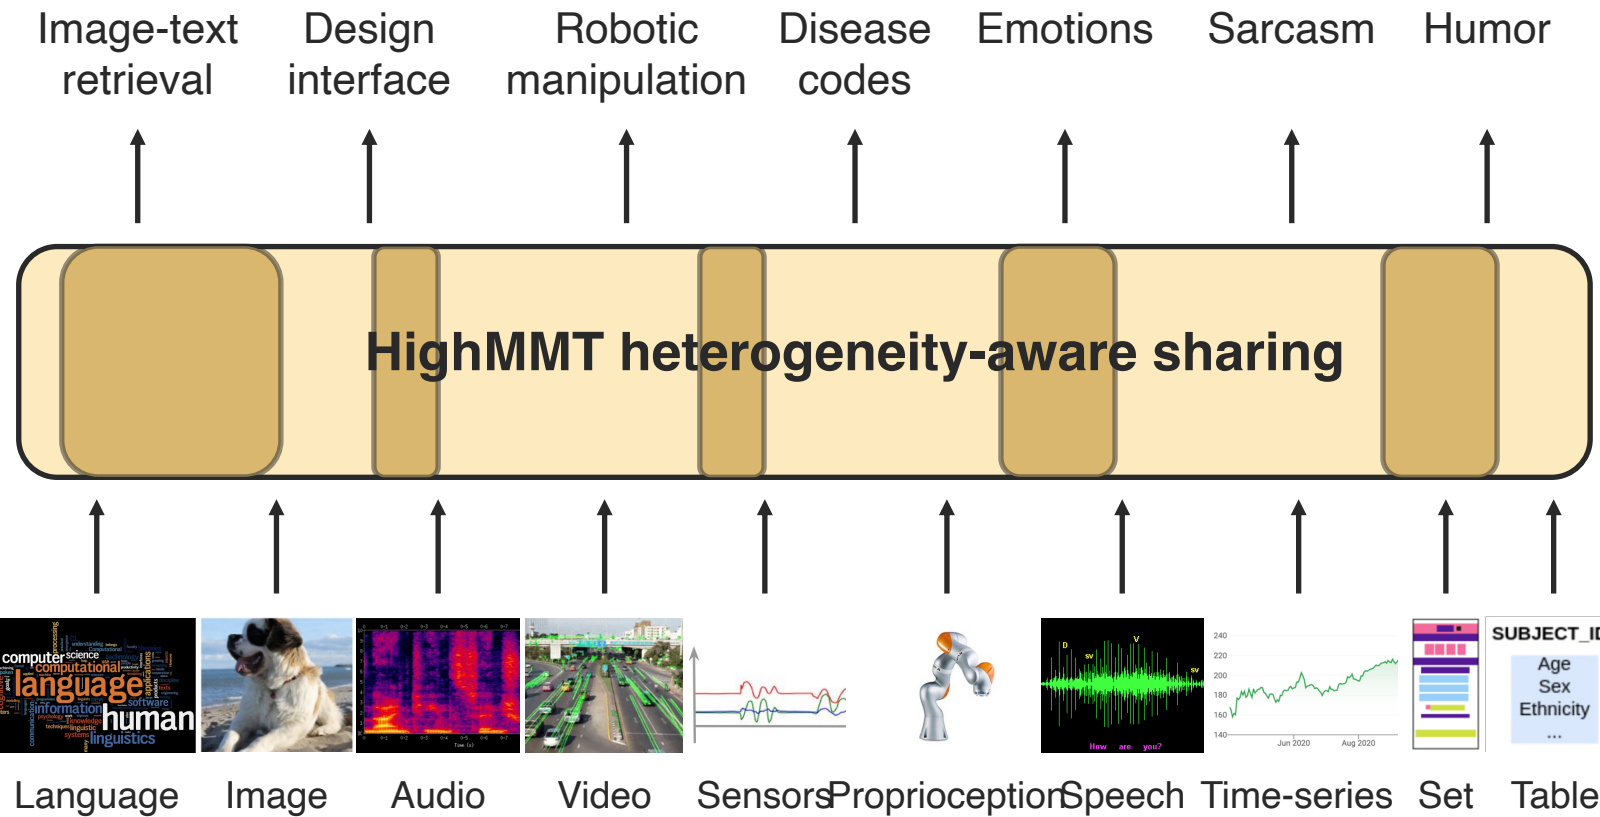

- All model combinations (>10,000)
- Pareto front
- HighMMT single-task
- HighMMT multitask

[Liang et al., HighMMT: Towards Modality and Task Generalization for High-Modality Representation Learning. arXiv 2022]

# Multitask and Transfer Learning

HighMMT heterogeneity-aware sharing: estimate heterogeneity to determine parameter sharing

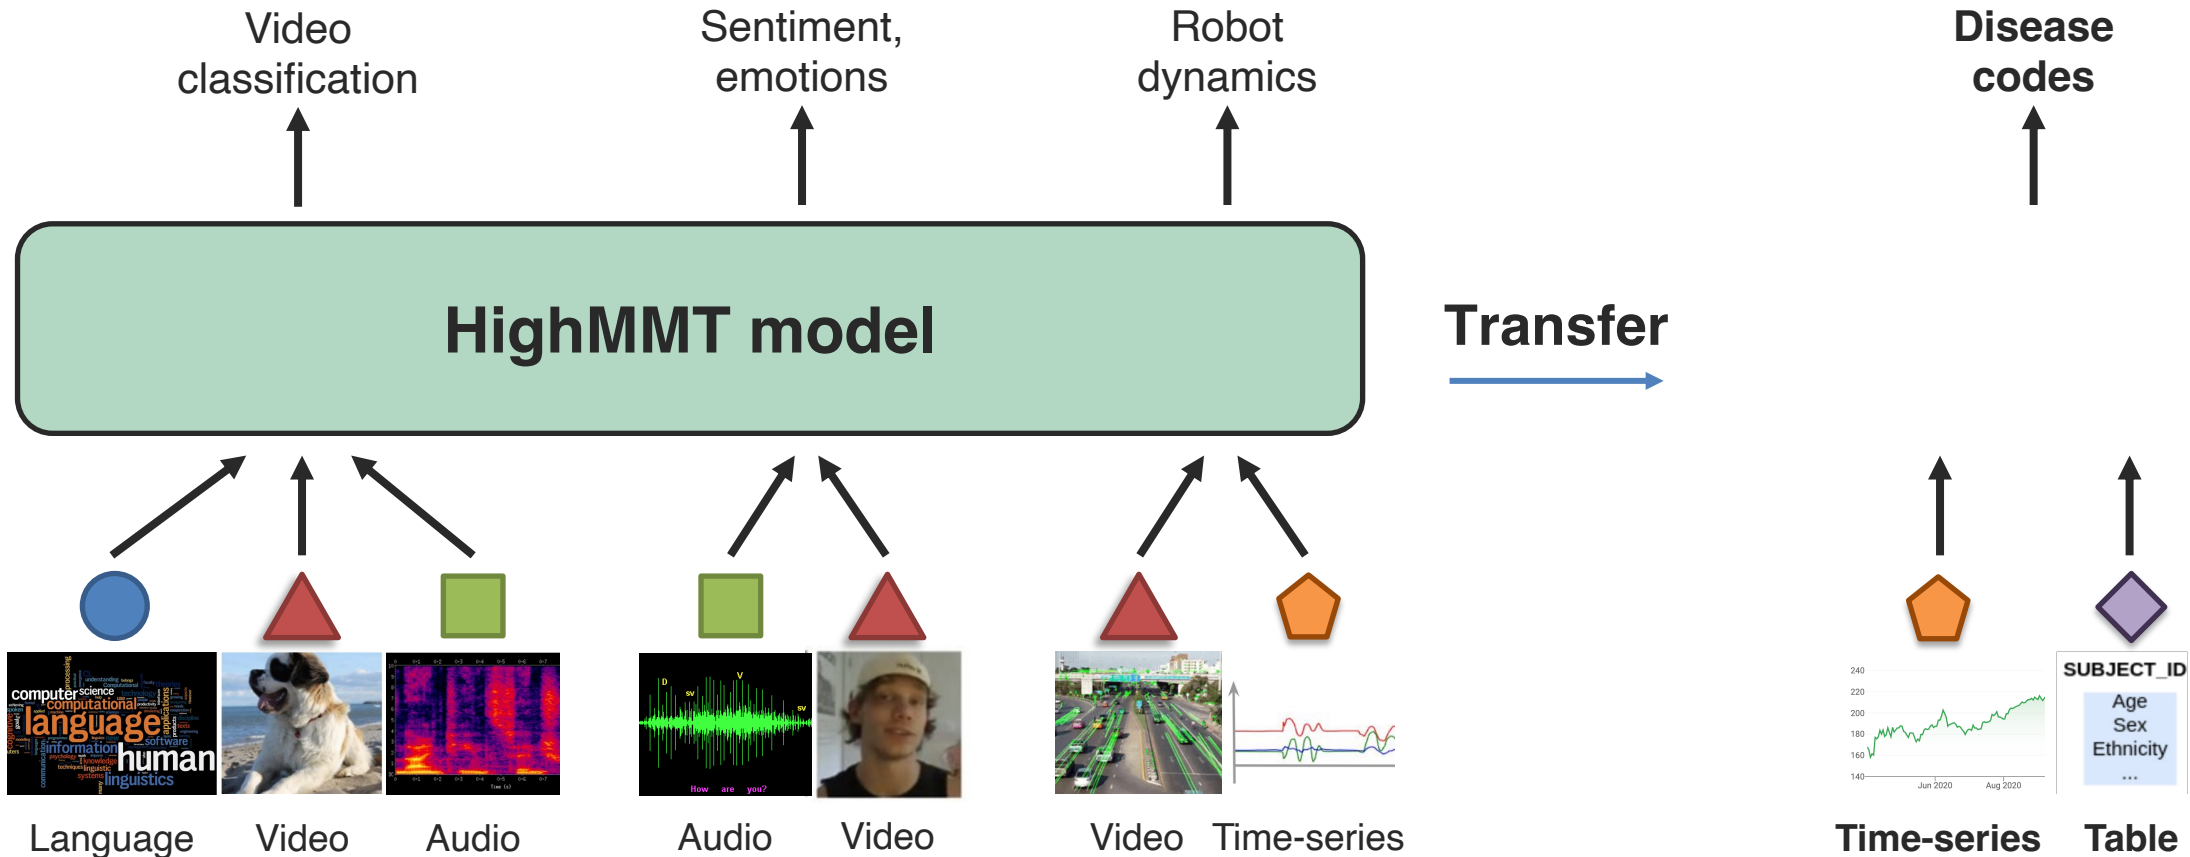

- All model combinations (>10,000)
- Pareto front
- HighMMT single-task
- HighMMT multitask
- **HighMMT heterogeneity-aware**

[Liang et al., HighMMT: Towards Modality and Task Generalization for High-Modality Representation Learning. arXiv 2022]

# Multitask and Transfer Learning

## Transfer across partially observable modalities

HighMMT: unified model + parameter sharing + multitask and transfer learning

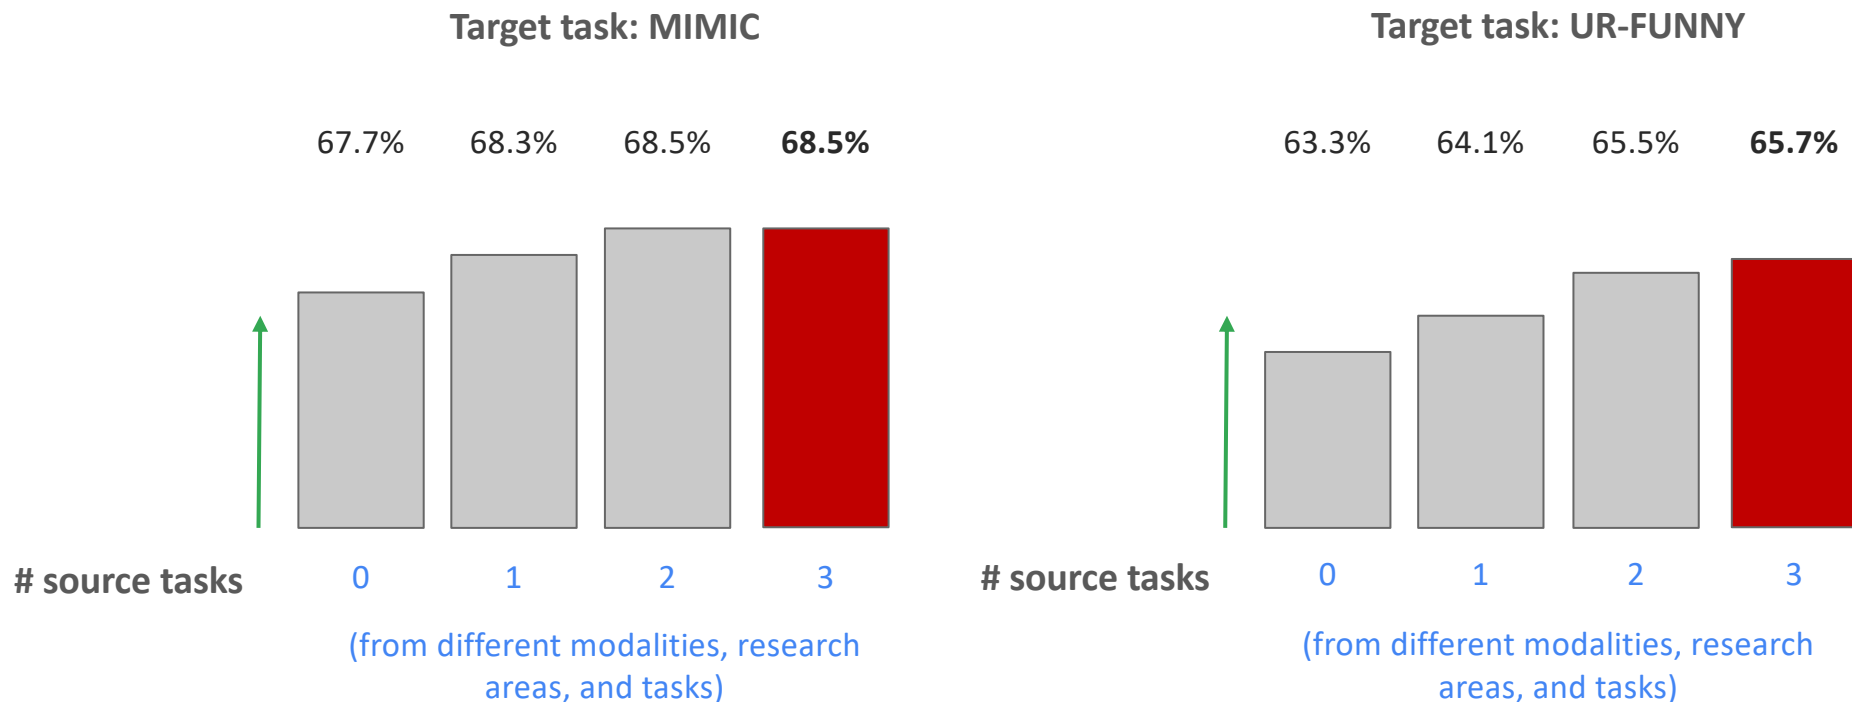

[Liang et al., HighMMT: Towards Modality and Task Generalization for High-Modality Representation Learning. arXiv 2022]

# Multitask and Transfer Learning

## Transfer across partially observable modalities

HighMMT: unified model + parameter sharing + multitask and transfer learning

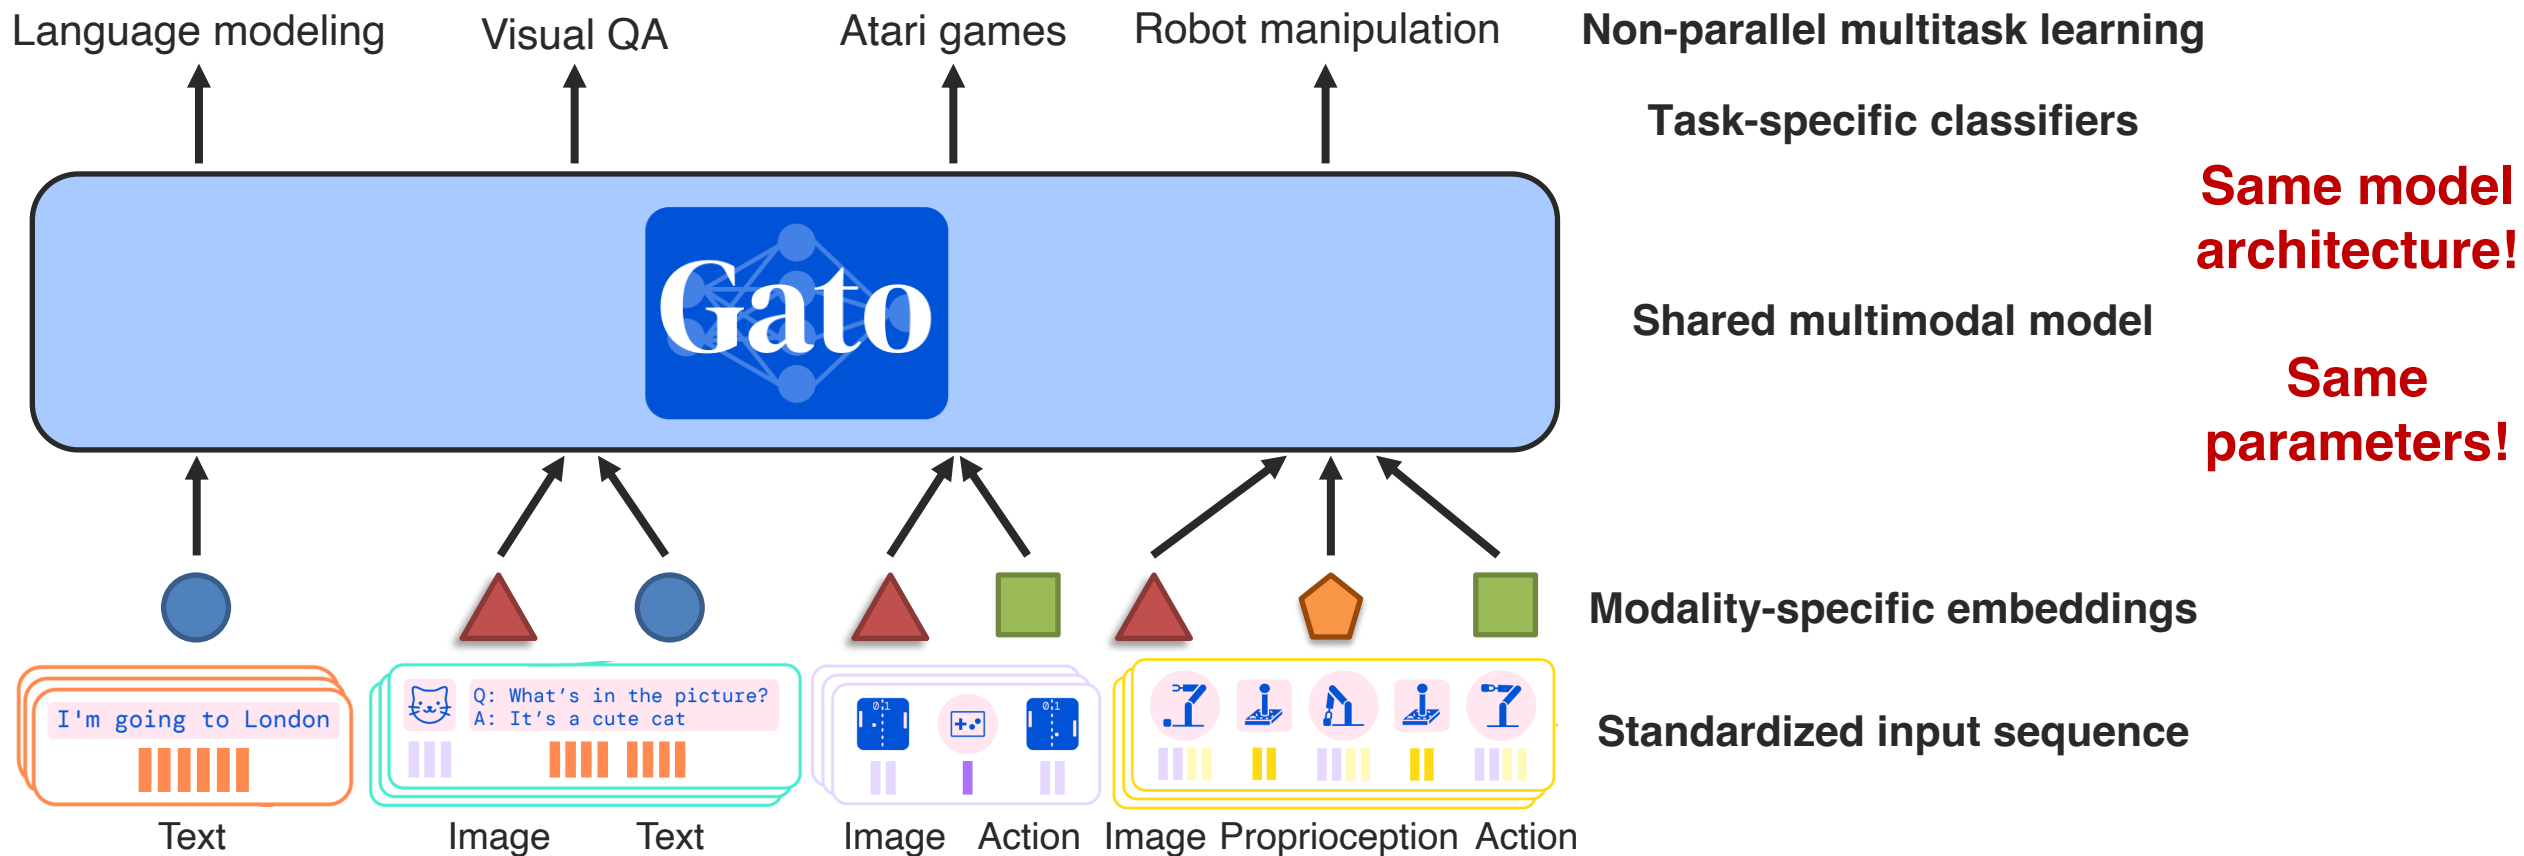

Achieves both multitask and transfer capabilities across modalities and tasks

[Liang et al., HighMMT: Towards Modality and Task Generalization for High-Modality Representation Learning. arXiv 2022]

# Multitask and Transfer Learning

## Transfer across partially observable modalities

Gato: unified model + parameter sharing + multitask learning

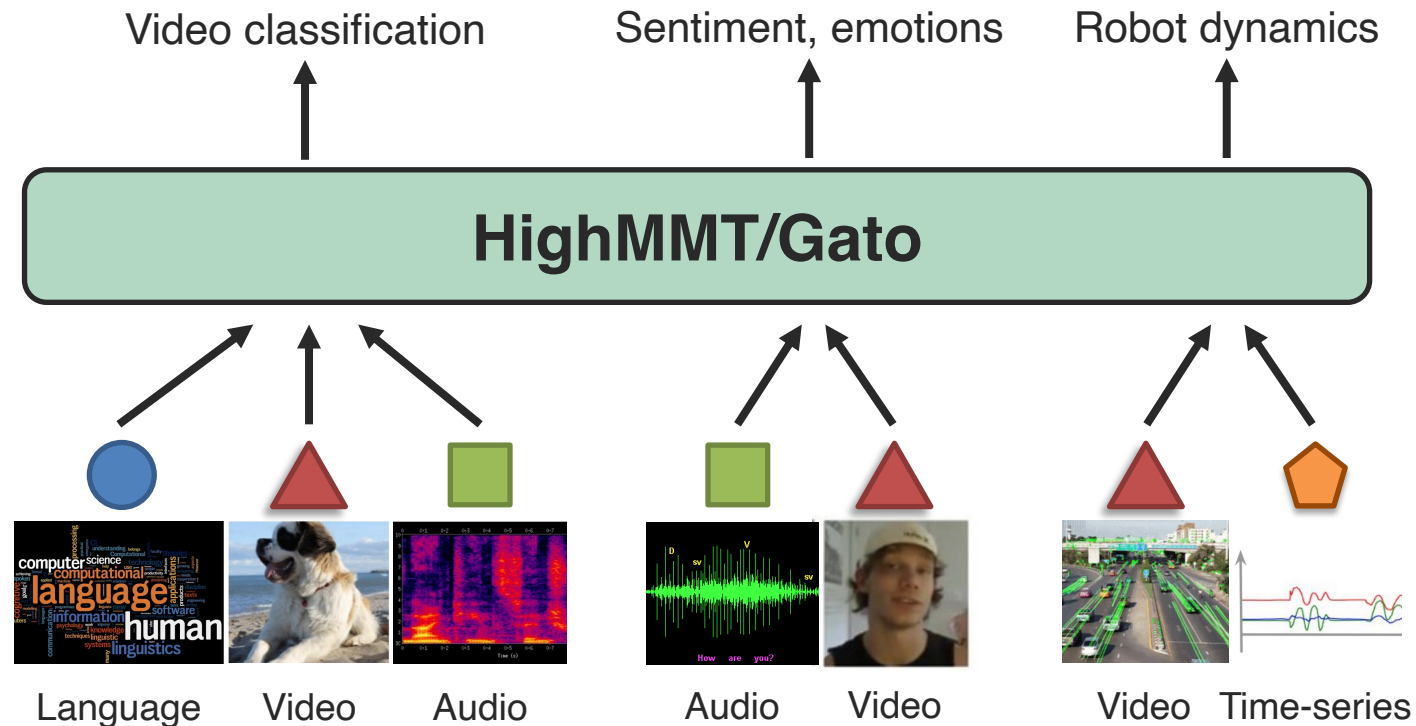

[Reed et al., A Generalist Agent. arXiv 2022]

# Multitask and Transfer Learning

Open challenges

## Some implicit assumptions:

- All modalities can be represented as sequences without losing information.
- Dimensions of heterogeneity can be perfectly captured by modality-specific embeddings.
- Cross-modal connections & interactions are shared across modalities and tasks.

Shared multimodal model?

Modality-specific embeddings?

Standardized input sequence?

[Liang et al., HighMMT: Towards Modality and Task Generalization for High-Modality Representation Learning. arXiv 2022]

# Multitask and Transfer Learning

Open challenges

## Many more dimensions of transfer

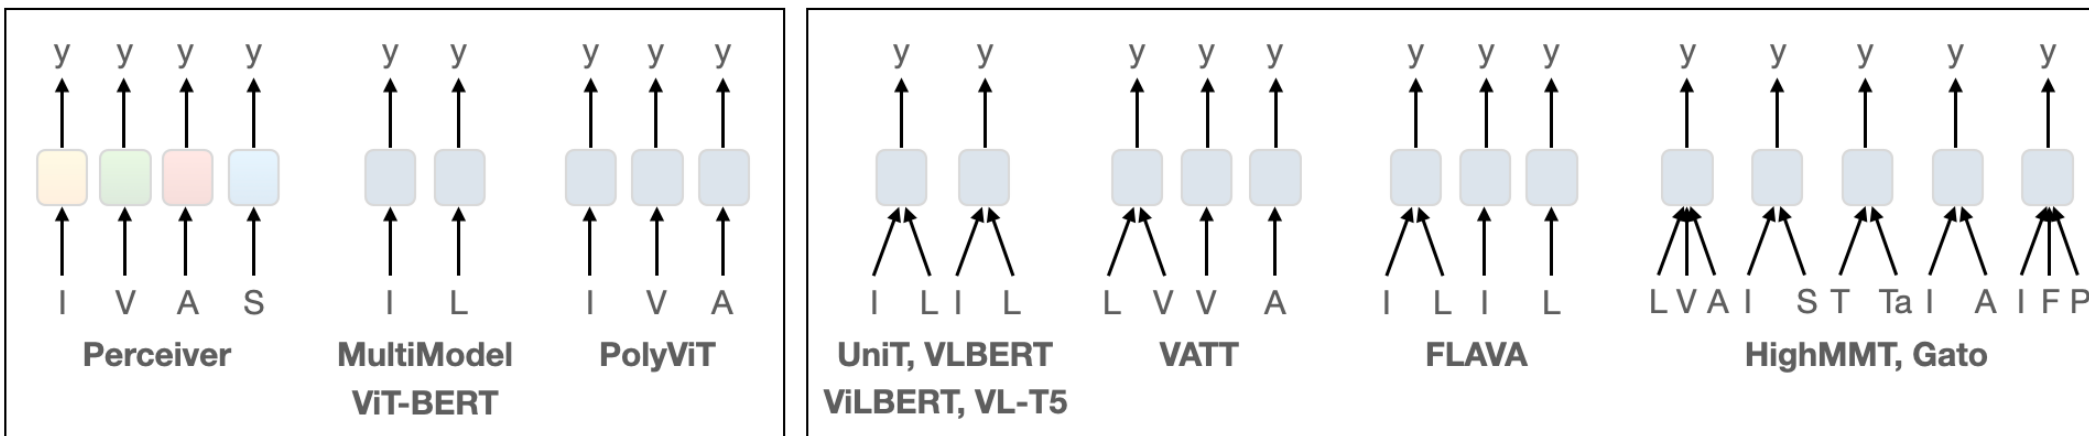

Unified encoder for unimodal learning

Multimodal multitask learning

I: image  
V: video  
A: audio  
S: set  
L: language  
T: time-series  
Ta: tables  
F: force sensor  
P: proprioception sensor

common architecture

parameter sharing

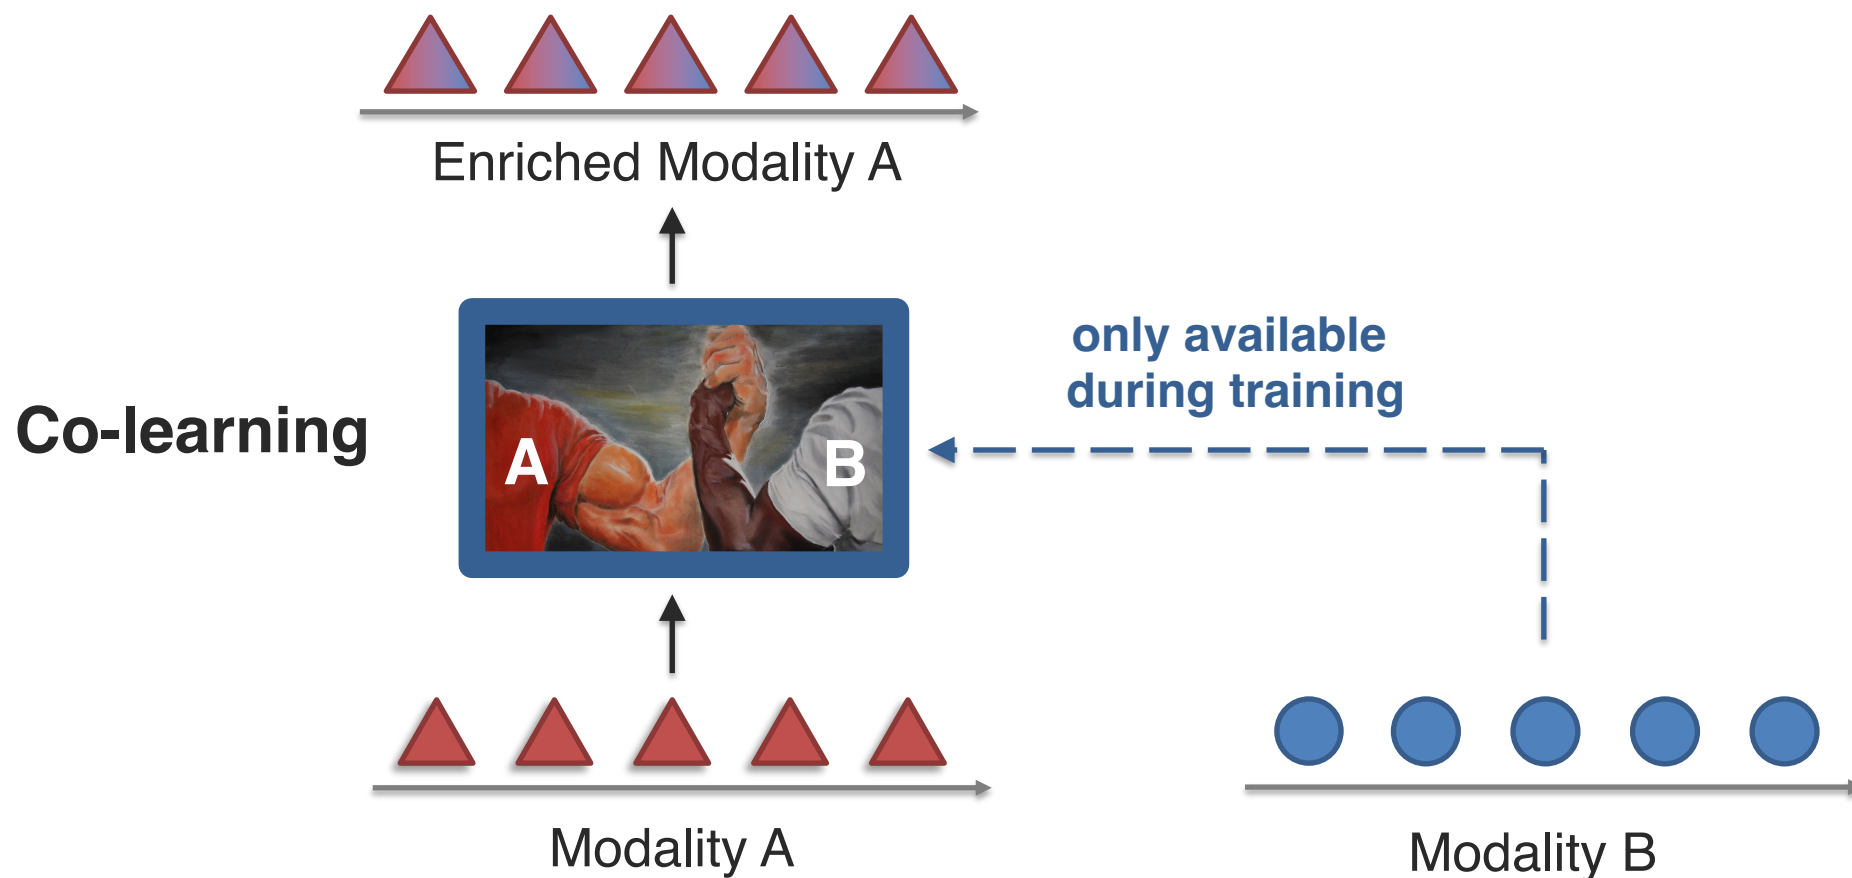

## Open challenges:

- Low-resource: little downstream data, lack of paired data, robustness (next section)
- Beyond language and vision
- Settings where SOTA unimodal encoders are not deep learning e.g., tabular data
- Complexity in data, modeling, and training
- Interpretability (next section)

## Sub-Challenge 5b: Co-learning

**Definition:** Transferring information from secondary to primary modality by sharing representation spaces between both modalities.

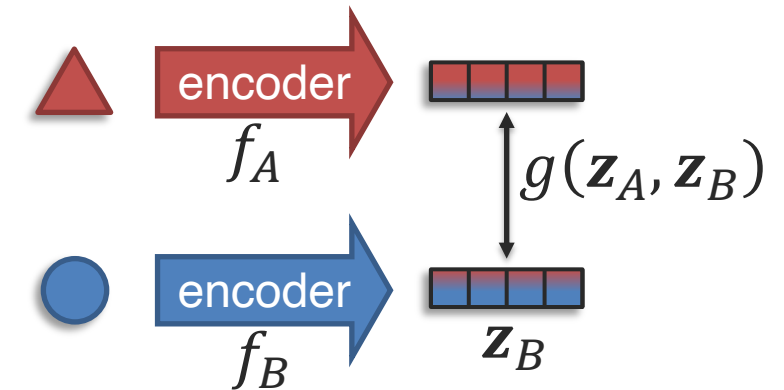

# Co-learning via Representation

Representation coordination: word embedding space for zero-shot visual classification

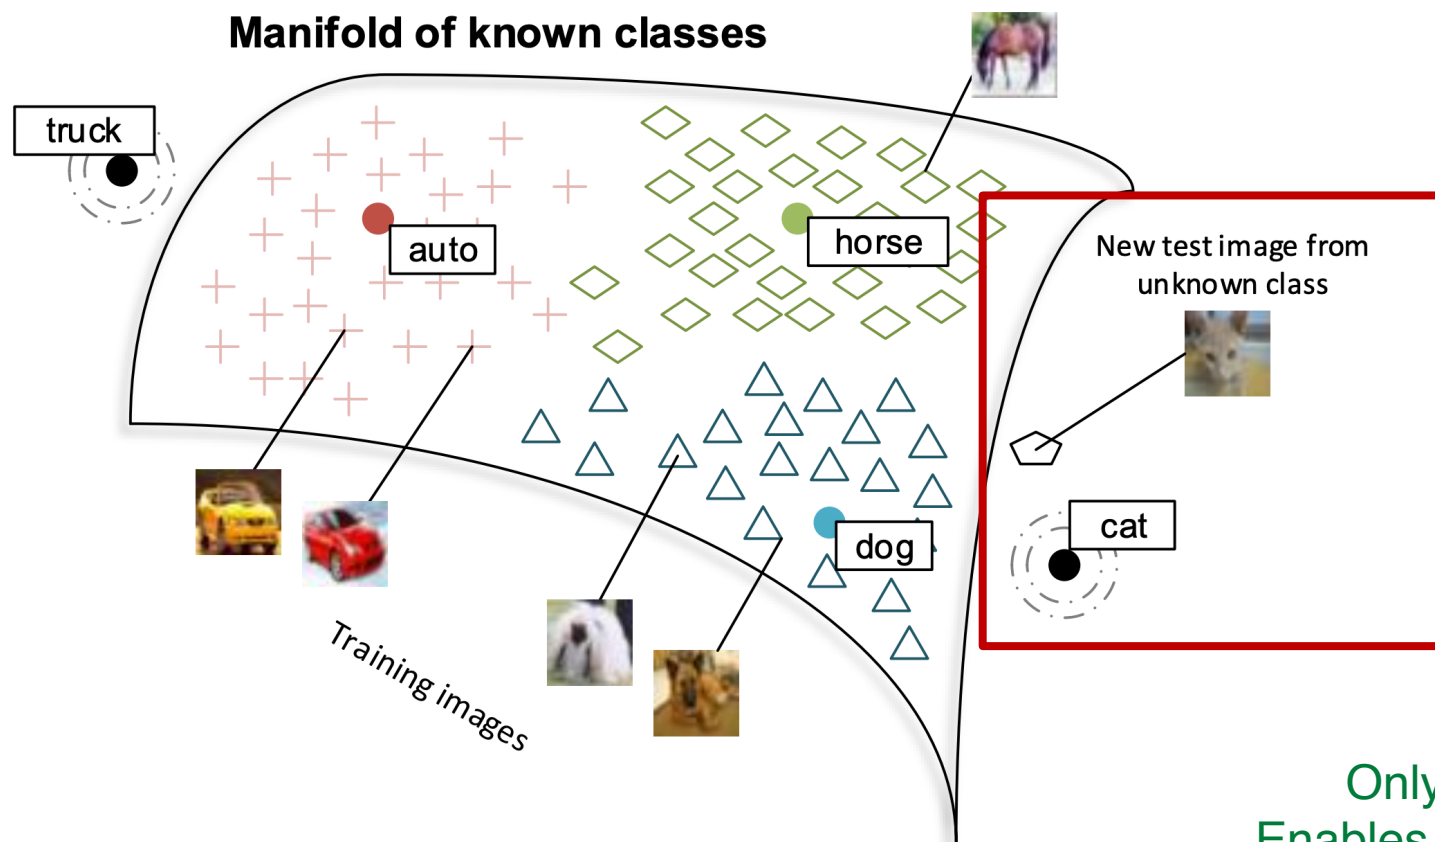

Recall representation coordination!

[Socher et al., Zero-Shot Learning Through Cross-Modal Transfer. NeurIPS 2013]

# Co-learning via Representation

Representation coordination: word embedding space for zero-shot visual classification

Recall representation coordination!

Only images used at test-time  
Enables zero-shot image classification

[Socher et al., Zero-Shot Learning Through Cross-Modal Transfer. NeurIPS 2013]

# Co-learning via Representation

## Representation fusion

## Multimodal co-learning

## Unimodal learning

Only text used at test-time

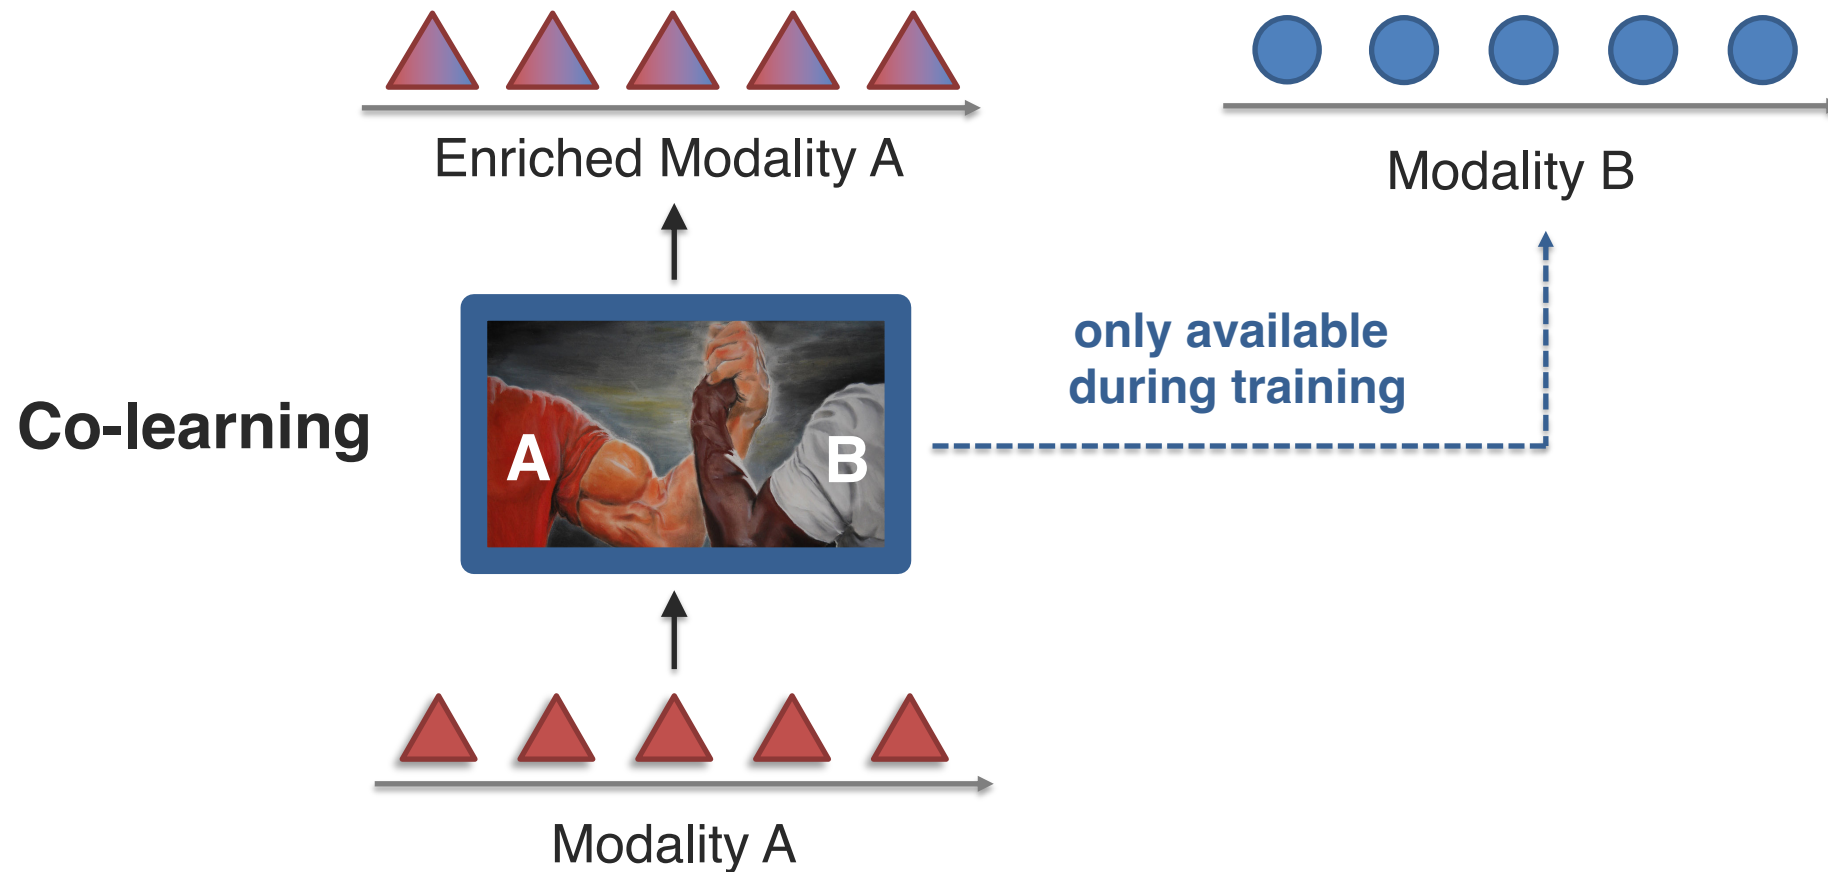

Multimodal co-learning > language-only training

# Co-learning via Generation

**Definition:** Transferring information from secondary to primary modality by using the secondary modality as a generation target.

# Co-learning via Generation

---

## Bimodal translations

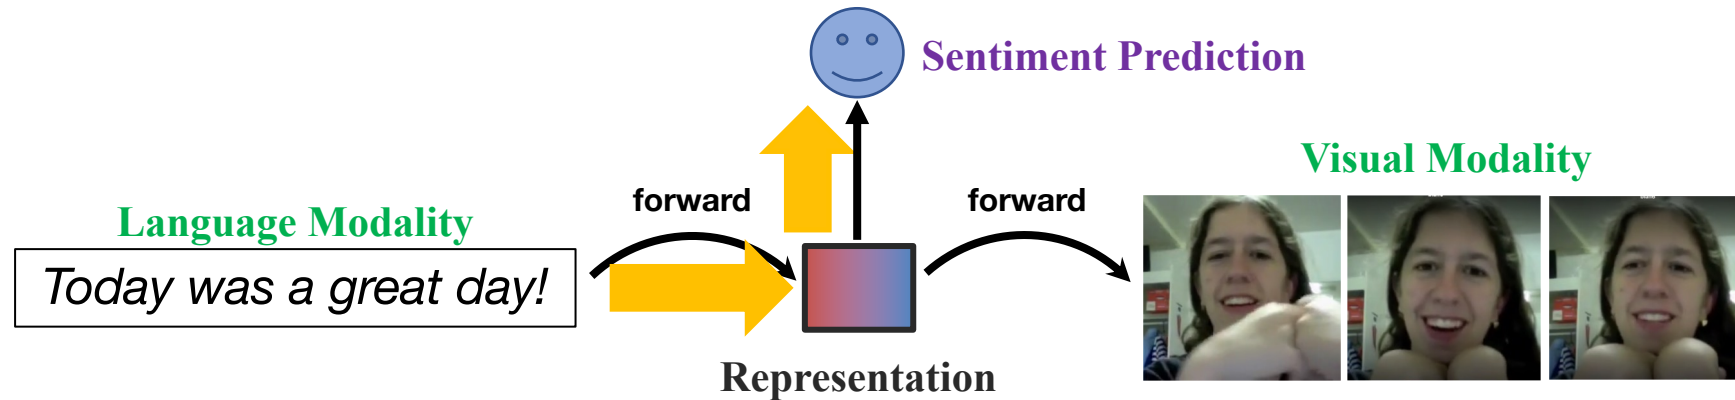

Both modalities required at test time!  
Sensitive to noisy/missing visual modality.

We want to leverage information from visual modality  
while being robust to it during test-time.

[Pham et al., Found in Translation: Learning Robust Joint Representations via Cyclic Translations Between Modalities. AACL 2019]

# Co-learning via Generation

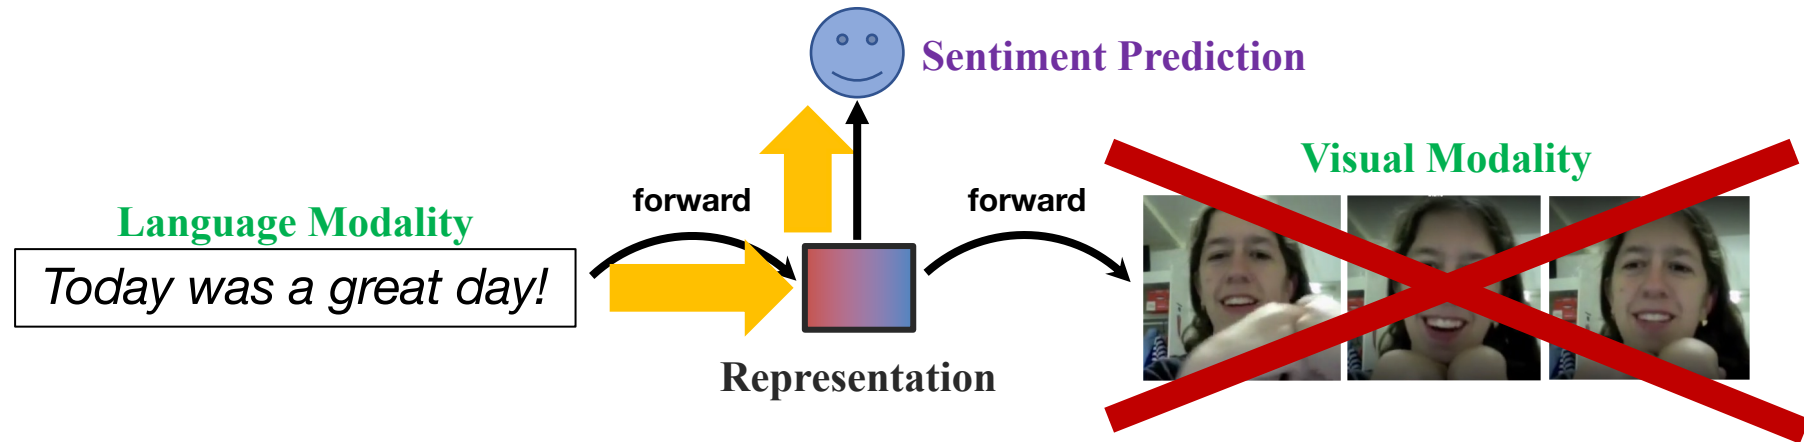

## Bimodal translations

Cross-modal translation during training  
Only language modality required at test time!

# Co-learning via Generation

## Bimodal translations

Problem: how do you ensure that both modalities are being used?

# Co-learning via Generation

## Bimodal cyclic translations

Solution: cyclic translations from visual back to language

Cross-modal translation during training  
Only language modality required at test time!

[Pham et al., Found in Translation: Learning Robust Joint Representations via Cyclic Translations Between Modalities. AAAI 2019]

# Co-learning via Generation

## Predicting images from corresponding language

Voken (visual token) classification

Masked language modeling

[learn] [listening]

BERT language model

Humans [mask] language by [mask] speaking

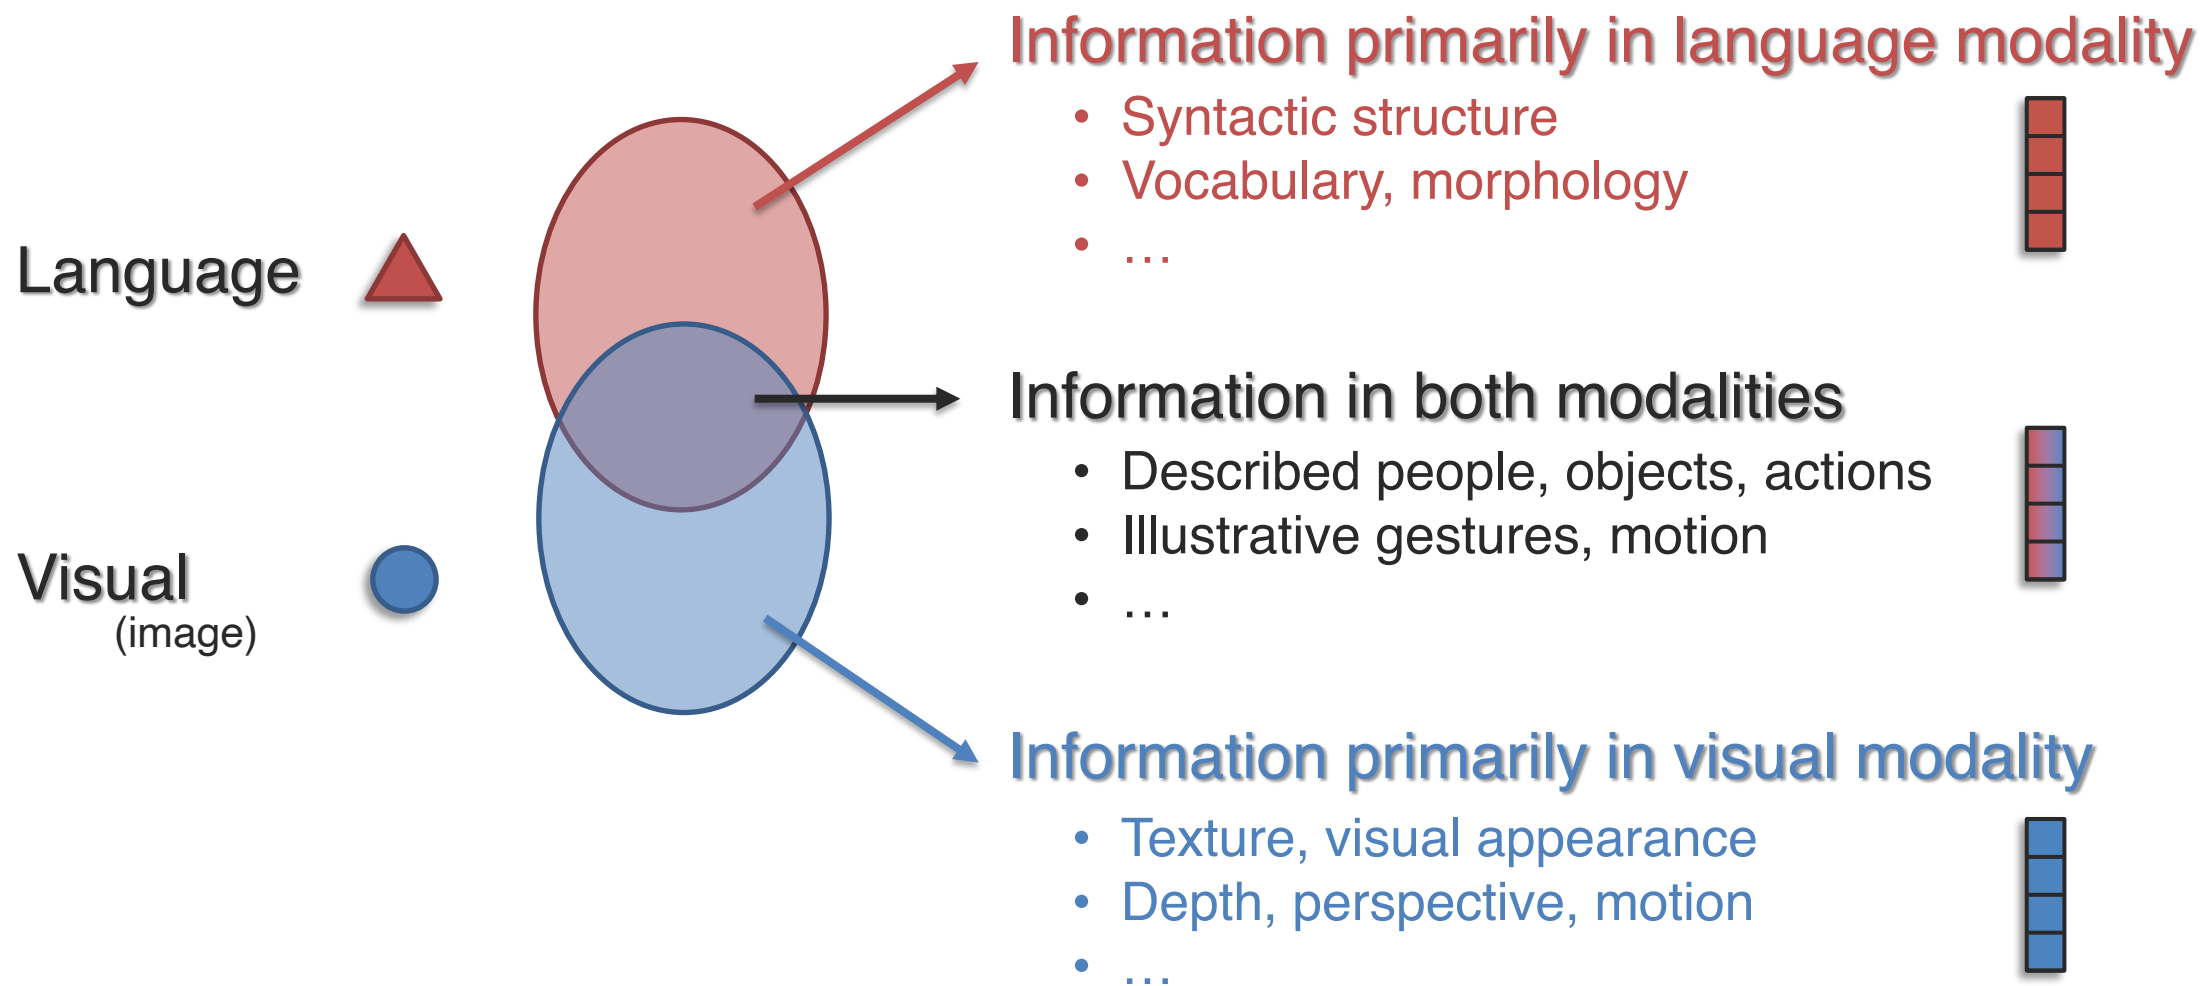

Only text used at test-time

Multimodal co-learning > language-only training

[Tan and Bansal, Vokenization: Improving Language Understanding with Contextualized, Visual-Grounded Supervision. EMNLP 2020]

# Co-learning via Generation

## Sub-challenge 5c: Model Induction

---

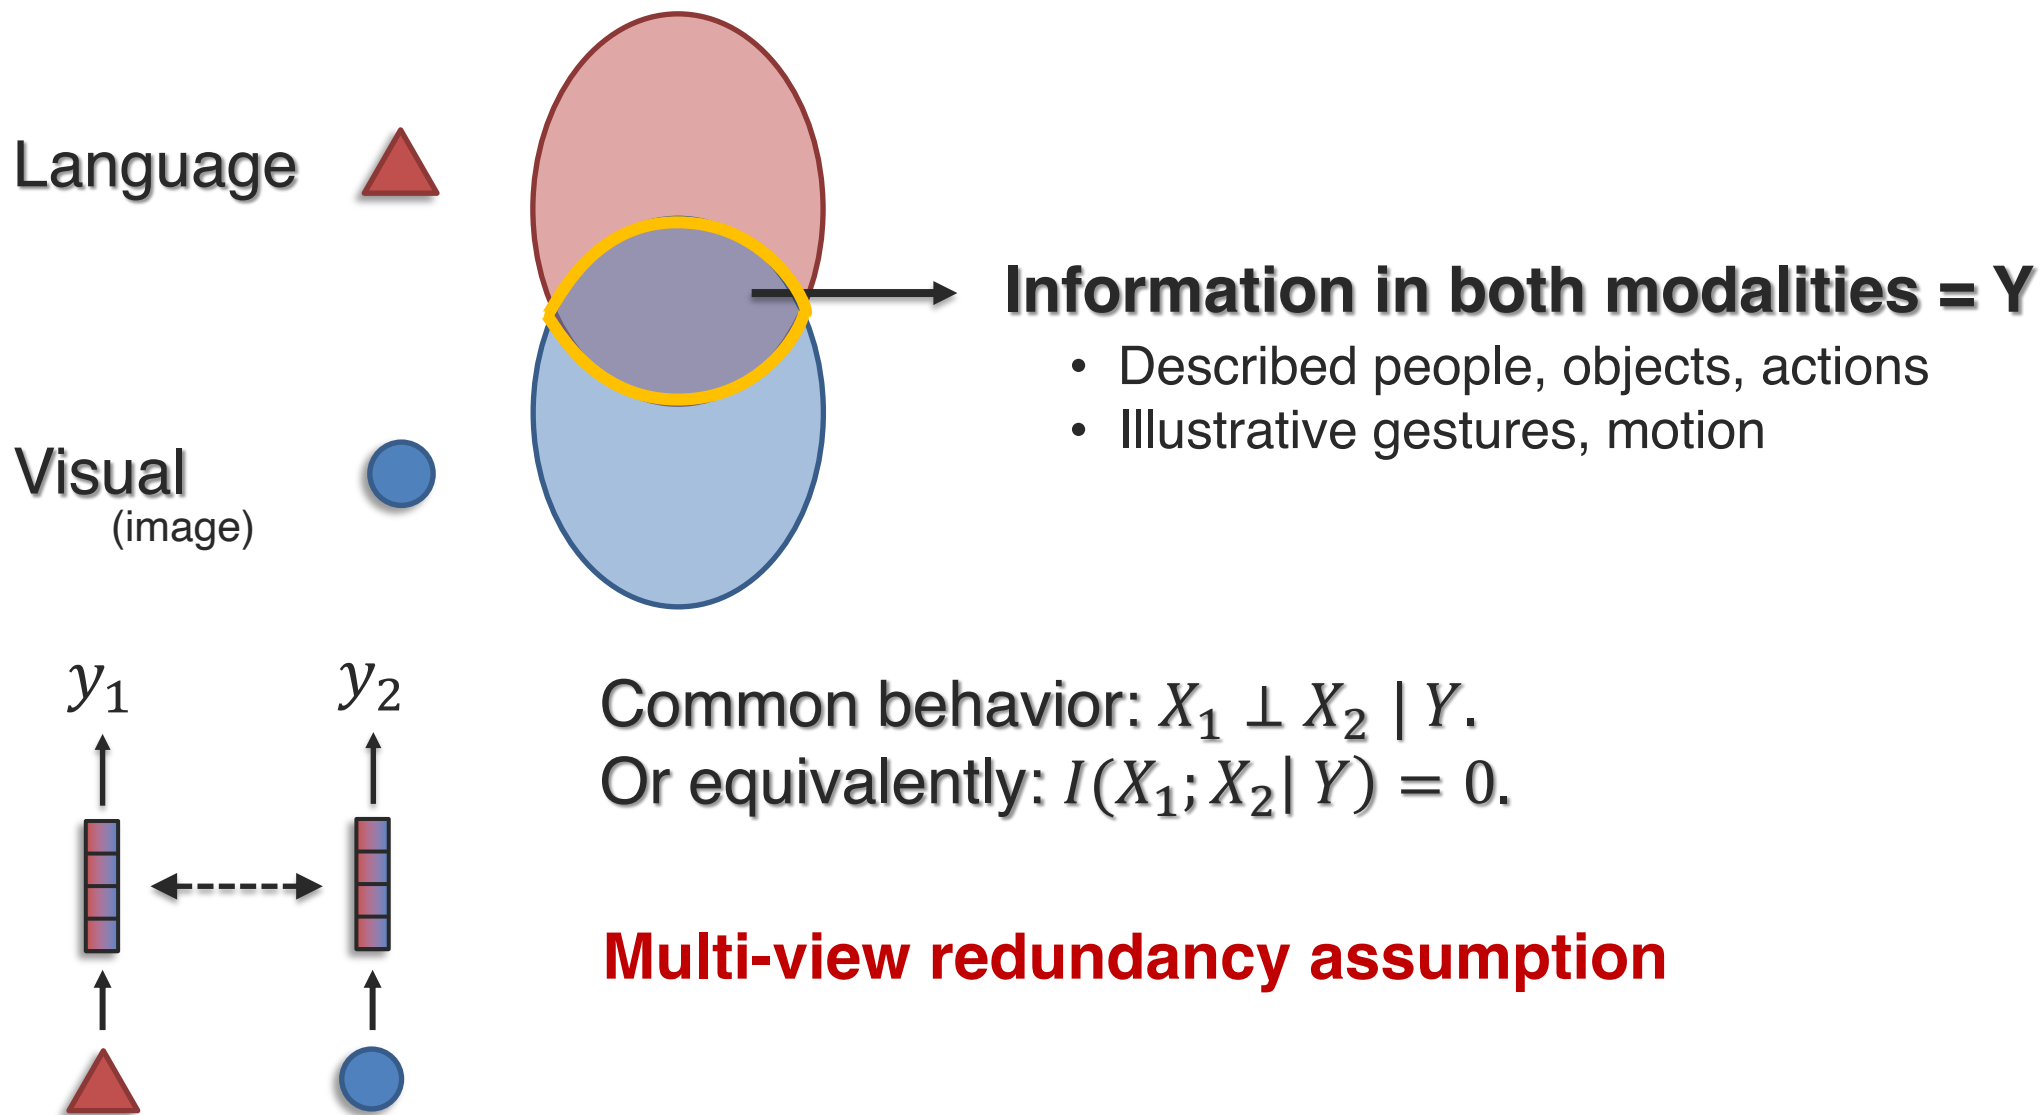

**Definition:** Keeping individual unimodal models separate but inducing common behavior across separate models.

### Model Induction

## Sub-challenge 5c: Model Induction

# Co-training

## Setup

Common behavior:  $X_1 \perp X_2 \mid Y$ .  
Or equivalently:  $I(X_1; X_2 \mid Y) = 0$ .

## Multi-view redundancy assumption

1.  $X_1$  = text on the web page.
2.  $X_2$  = text on hyperlinks pointing into the web page.
3.  $Y$  = category of web page: academic, sports, news, music etc.

# Co-training

## Algorithm

Assume:

1. Labeled data  $\{X_1, X_2, Y\}$ .
2. Unlabeled data  $\{X_1, X_2\}$ .

Train:

1. Train classifier  $f_1$  on  $\{X_1, X_2, Y\}$  and  $f_2$  on  $\{X_1, X_2, Y\}$ .
2. Use classifier  $f_1$  to label the most confident examples in  $\{X_1, X_2\}$  and add it to the labeled set  $\{X_1, X_2, Y = f_1(X_1)\}$ .
3. Use classifier  $f_2$  to label the most confident examples in  $\{X_1, X_2\}$  and add it to the labeled set  $\{X_1, X_2, Y = f_2(X_2)\}$ .
4. Go to 1, and repeat until there are no more unlabeled samples.

Test:

1. For a new unlabeled sample  $\{X_1, X_2\}$ , ensemble  $f_1(X_1)$  and  $f_2(X_2)$ .

# Self-training

---

## Warmup: a single view – Self-training

Assume:

1. Labeled data  $\{X_1, Y\}$ .
2. Unlabeled data  $\{X_1\}$ .

Train:

1. Train classifier  $f_1$  on  $\{X_1, Y\}$ .
2. Use classifier  $f_1$  to label the most confident examples in  $\{X_1\}$  and add it to the labeled set  $\{X_1, Y = (X_1)\}$ .
3. Go to 1, and repeat until there are no more unlabeled samples.

Test:

1. For a new unlabeled sample  $\{X_1\}$ , output  $f_1(X_1)$ .

# Self-training

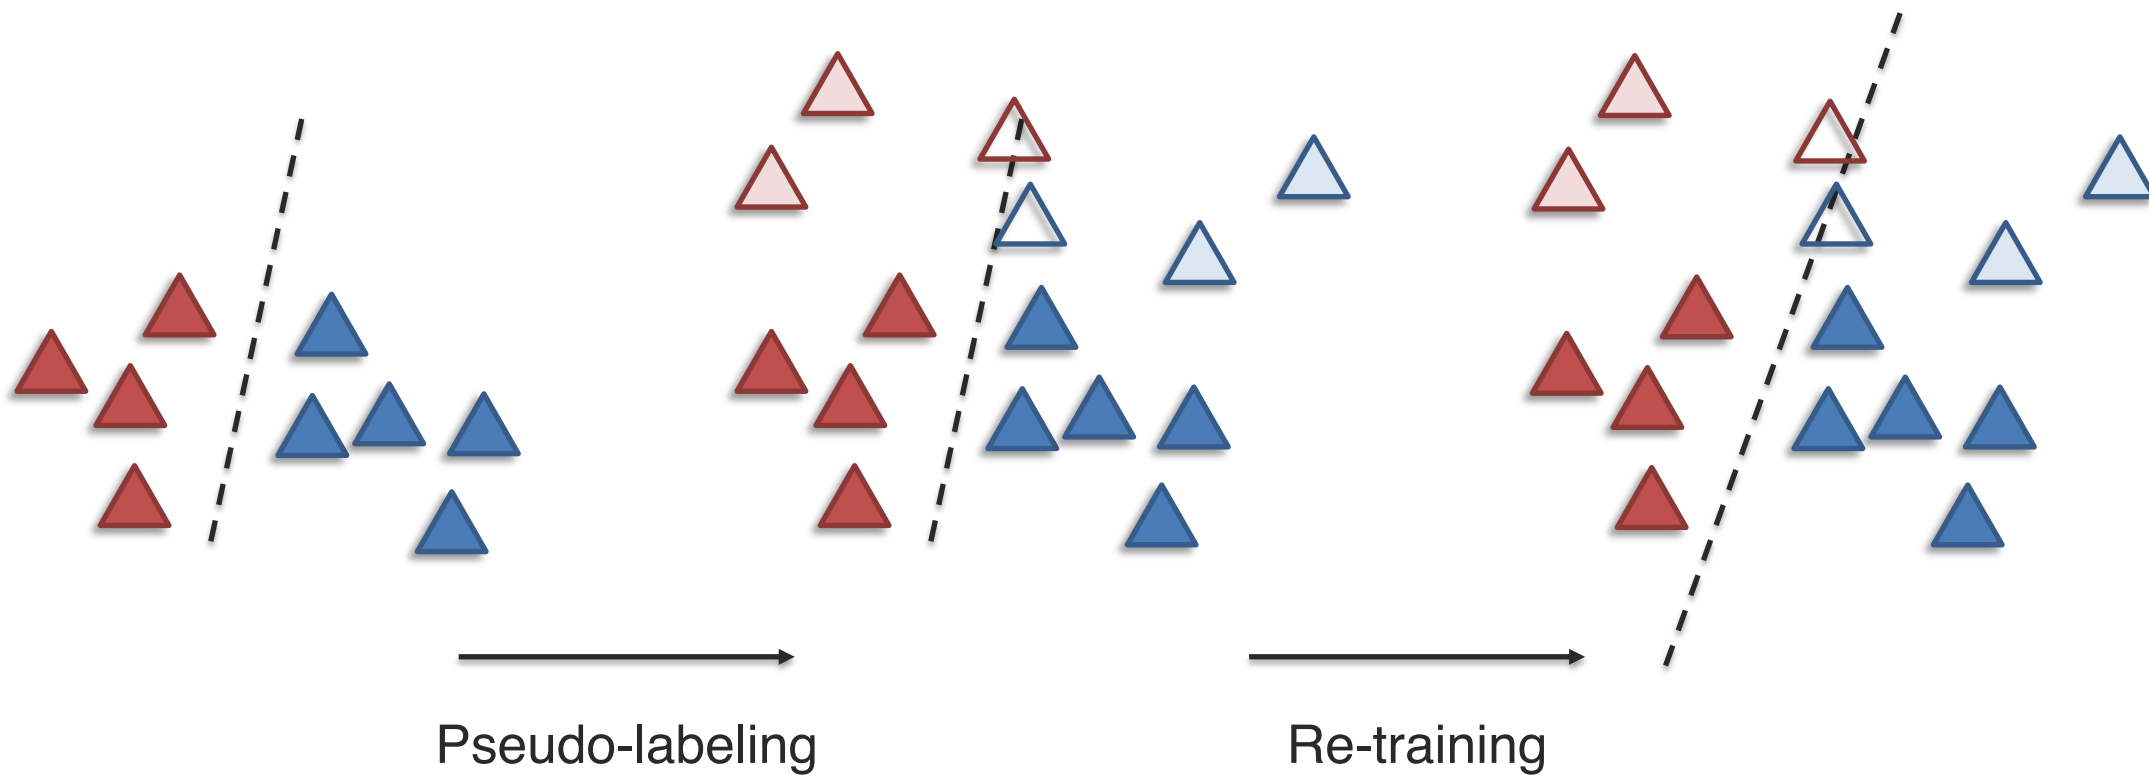

---

## Warmup: a single view – Self-training

# Self-training

## Warmup: a single view – Self-training

# Self-training

## Warmup: a single view – Self-training

# Self-training

**Key-words: semi-supervised learning, label propagation, domain adaptation/shift**

Critical:

1. Can't label all unlabeled data in one step, or you recover original classifier just trained on labeled data.
2. Sequence of pseudo-labeling is important to gradually shift classification boundary.
3. Input consistency regularization: shape of data space is important – implicit assumption that similar datapoints have similar labels (i.e., label consistency)

Input consistency:

- Data augmentation
- Adding noise

[Wei et al., Theoretical Analysis of Self-Training with Deep Networks on Unlabeled Data. ICLR 2021]

# Co-training

## Co-training

Assume:

1. Labeled data  $\{X_1, X_2, Y\}$ .
2. Unlabeled data  $\{X_1, X_2\}$ .

Train:

1. Train classifier  $f_1$  on  $\{X_1, X_2, Y\}$  and  $f_2$  on  $\{X_1, X_2, Y\}$ .
2. Use classifier  $f_1$  to label the most confident examples in  $\{X_1, X_2\}$  and add it to the labeled set  $\{X_1, X_2, Y = f_1(X_1)\}$ .
3. Use classifier  $f_2$  to label the most confident examples in  $\{X_1, X_2\}$  and add it to the labeled set  $\{X_1, X_2, Y = f_2(X_2)\}$ .
4. Repeat until there are no more unlabeled samples.

Test:

1. For a new unlabeled sample  $\{X_1, X_2\}$ , ensemble  $f_1(X_1)$  and  $f_2(X_2)$ .

# Co-training

## Co-training

1.  $X_1$  = text on the web page,  $X_2$  = text on hyperlinks pointing into the web page.
3.  $Y$  = category of web page: academic, sports, news, music etc.

I am tenure-track Faculty at CMU Language Technology Institute where I lead the Multimodal Communication and Machine Learning Laboratory ([MultiComp Lab](#)). I was previously Research Faculty at USC Computer Science Department. I received my Ph.D. in Computer Science from MIT Computer Science and Artificial Intelligence Laboratory.

My research focuses on building the computational foundations to enable computers with the abilities to analyze, recognize and predict subtle human communicative behaviors during social interactions. Central to this research effort is the technical challenge of multimodal machine learning: mathematical foundation to study heterogeneous multimodal data and the contingency often found between modalities. This multi-disciplinary research topic overlaps the fields of multimodal interaction, social psychology, computer vision, machine learning and artificial intelligence, and has many applications in areas as diverse as medicine, robotics and education.

I am a fourth-year Ph.D. student in the [Machine Learning Department](#) at [Carnegie Mellon University](#), advised by [Louis-Philippe Morency](#) and [Ruslan Salakhutdinov](#). I also collaborate closely with [Manuel Blum](#), [Lenore Blum](#), and [Daniel Rubin](#) at Berkeley and Stanford. My research lies in the foundations of multimodal machine learning with applications in socially intelligent AI, understanding human and machine intelligence, natural language processing, healthcare, and education. As steps towards this goal, I work on:

Language  
Technologies  
Institute

Unlabeled, label using ' $f_1: X_1$  = CMU -> academic' and learn that ' $X_2$  = PhD program -> academic'

Another student -> Unlabeled, label using ' $f_2: X_2$  = PhD program -> academic' and learn that ' $X_1$  = Berkeley -> academic'

[Blum and Mitchell, Combining Labeled and Unlabeled Data with Co-Training. COLT 1998]

# Co-training

---

## From self-training to co-training

Assumptions:

1. Either view is sufficient to predict the label alone.
2. Views should be as independent as possible: examples where  $f_1$  has high confidence but not  $f_2$  and vice-versa.

# Co-training

---

## From self-training to co-training

[Blum and Mitchell, Combining Labeled and Unlabeled Data with Co-Training. COLT 1998]

# Co-training

---

## From self-training to co-training

[Blum and Mitchell, Combining Labeled and Unlabeled Data with Co-Training. COLT 1998]

# Co-training

From self-training to co-training

Key idea: functions on both views must be compatible and agree

[Blum and Mitchell, Combining Labeled and Unlabeled Data with Co-Training. COLT 1998]

# Co-training

---

## From self-training to co-training

**Key idea: functions on both views must be compatible and agree**

Intuitions:

1. Either view is sufficient to predict the label alone.
2. Views should be as independent as possible: examples where  $f_1$  has high confidence but not  $f_2$  and vice-versa.
3. Input consistency regularization: shape of data space is important – implicit assumption that similar datapoints have similar labels (i.e., label consistency).
  - In co-training, data from another view help us to supplement the label space!
  - Views independent given label = points in different views being in different spaces.
  - Both views must agree = input consistency which enables cross-view pseudo-labeling.
4. Eventually, will converge on 2 classifiers that agree and each separate both views.

# Co-training

## Recent applications of co-training

Self-supervised learning with positive and negative samples

- Positive samples hard to discover in RGB space can be easily found in flow space, and vice-versa (e.g., RGB sensitive to background differences but not flow).
- Can use co-training between 2 RGB and flow contrastive learning modules.

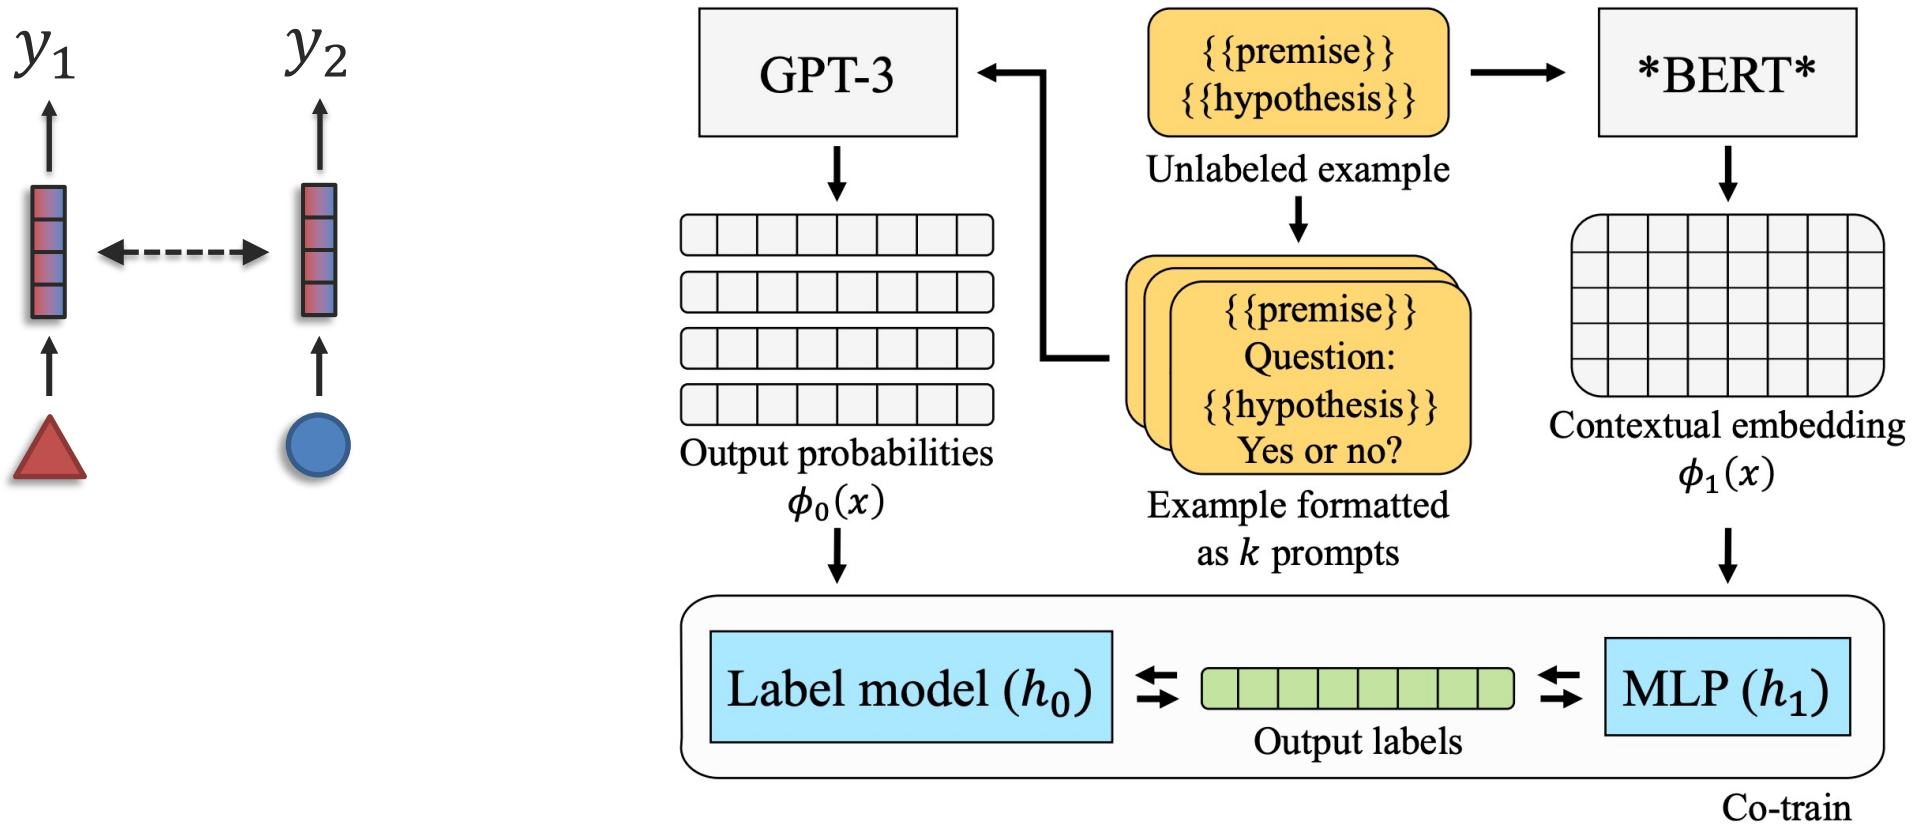

[Han et al., Self-supervised Co-training for Video Representation Learning. NeurIPS 2020]

# Co-training

## Recent applications of co-training

### Language-model prompting

[Lang et al., Co-training Improves Prompt-based Learning for Large Language Models. ICML 2022]

# Co-Regularization

---

## Co-regularization

Add a loss term to ensure both model predictions are similar:

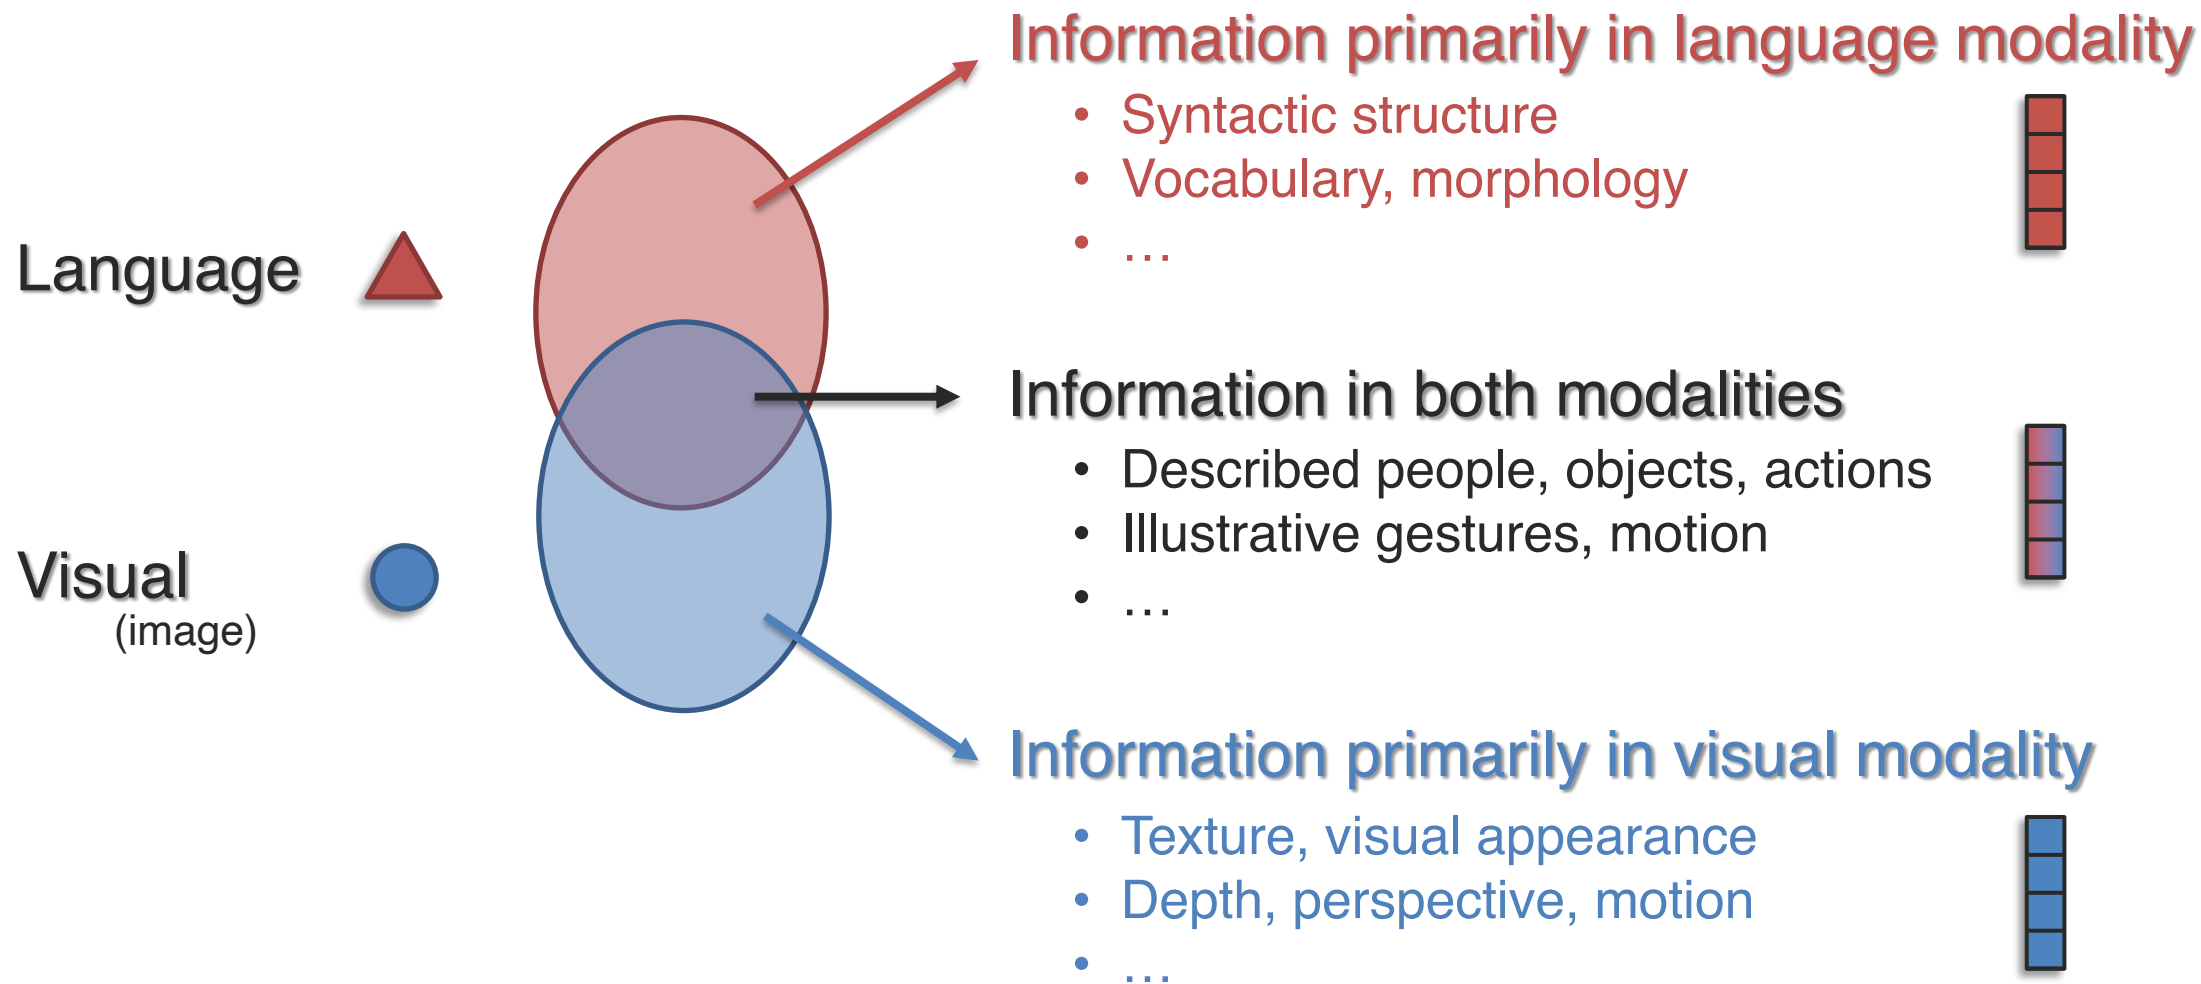

$$L = (f_1(X_1) - f_2(X_2))^2$$

Recall representation coordination.

## Sub-challenge 5c: Model Induction

---

## Summary: Transference

---

**Definition:** Transfer knowledge between modalities, usually to help the primary modality which may be noisy or with limited resources.

**Sub-challenges:**

### Transfer

### Co-learning

### Model Induction

# More Transference

---

Open  
challenges

Many more dimensions of transfer:

- Multimodal {multitask, transfer, few-shot, meta} learning.
- Domain adaptation, domain shift, label shift.
- Core: representation, alignment, reasoning!

## Open challenges:

- Low-resource: little downstream data, lack of paired data, robustness (next section).
- Settings where SOTA unimodal encoders are not deep learning e.g., tabular data.
- Evaluating reasoning and robustness and large models.
- Limits of transfer beyond redundancy/joint information.
- Interpretability (next section).
